it the state of the rest D. A., and to be

The Author's Chille Dedicatory.

To all my dear Brethren, the Sworn Master-Chirurgeons of the City of Paris.

GENTLEMEN,

Anting a firm and folid Prop for the weakness of my Conceptions, I will imitate the generality of Authors, who choose the protection of some credible Persons, under

whose Names to publish their Works to the World: But I'le not follow the custom of those who dedicate them for the most part to Persons wholly ignorant of the Matter treated on, from no other Inducement but a mercenary Recompence. This (Gentlemen) obligeth me to address my self to you (as to the only sit Judges of it) and to offer you the first Fruits of my Labours, which might run the hazard of being gnawed by the Worm of Envy, if not put into your hands to protect. I offer it you, in acknowledgment of the Honour you did me, when some time since you received me into your samous Company; and to acquit my self of

The Author's

the Obligation I owed you: for, being a Member of your Body, all my pains ought to be for you. This is the reason why I could not present it to any other, without being guilty of a domestick Larciny. By giving it you, I am liberal of your proper Goods; or rather, I render you an account only of the Talent you entrusted me with to improve: I mean, the true Precepts of this noble Art of Chirurgery, of which your have a knowledg and experience so perfect, that every one is obliged openly to confess, that of you alone, amongst all the Chirurgeons of Europe, it may be justly said, Vos Sol, alios umbra regit.

I shall refrain, Gentlemen, to praise you upon this Subject, for (besides that it deserves a Pen more able than mine, to acquit it self according to your Merits) I fear, I should be silenced by such, as would allege for my so doing, that with which he once was reproached, who undertook to praise Hercules by publishing his Heroick Actions to the People of Lacedemonia: Who (answered one) doth not know him? and esteem him to be in the number of the immortal Gods? So likewise may it be said to me; Who knoweth not the Master-Chirurgeons of Paris? Is it not manifest that you are that fruitful

Epiftle Dedicatory.

ful Spring, to which they come from all places of Europe to draw the perfection of fo fair an Art? And whither many foreign Princes and Princesses are obliged to have, recourse for the preservation and recovery of their Health, which they believe cannot be obtained so easily, and with so much asfurance from any other as from you? Is it not known likewise, that our puissant Monarch hath this many Years entrusted wholly his Sacred Person into the hands of him, who through his Merits is at present the Head of your illustrious Body? Neither can it be forgotten, that this Great King did, through a fatherly goodness which he had for the preservation of the Nobility that accompanied him the last Year in his Conquests in Flanders, command three or four of you to stanch the Blood spilt before that mighty City de L'Isle, which he brought under his Obedience? Did it not then appear that divers Persons of great Quality (mortally wounded in fignalizing themselves at the Attaque of that strong Place) seem'd wholly reviv'd at the instant they received the news of these excellent Chirurgeons arrival, being confident to receive from them speedy and certain help? One might at the same time perceive the generosity of others extraordinarily 2 3 DESVOUL

The Author's

ordinarily augmented by the confidence of being in their safe hands. Let us therefore treat no longer of what none are ignorant; but rather make some few reflections on the Charity (which renders you every-where fo famous) in affilting gratis with your fage and prudent Counsels an infinity of Sick, who meet from all parts at St. Come, the first Monday of every Month in the Year, to consult you upon many Diseases, to all others (except you) incurable; despairing of a cure for their Maladies, if it descends not from your famous Magazine. This Charity also plainly appears in the Instruction you bestow gratis upon Students in Chirurgery, appointing some amongst you, to make them Demonstrations in Anatomy, and teach them the true Method of well performing all the Operations of Chirurgery 5 of which Commission I have had the honour to acquit my felf, as well as 'twas possible for me, three Years, in pursuance of an Order you gave me to that purpose: But (since in those Exercises, so ordered by you, we do not usually discourse of Women with Child, nor of their different Labours) I thought to discharge my self intirely of my Duty, you will not judg amis, my publishing this Book to the World, which I present you; in which I endeavour

Epistle Dedicatory.

deavour to demonstrate exactly the means of remedying many Indispositions of Women with Child and in Child-bed, with an exact Method of well-practifing the Art of Midwifery, being perswaded that it may be very profitable to young Chirurgeons living in the Country, where but very few sufficiently instructed in all things necessary to be known, can be met with; I have also the rather undertaken this, that Midwives may find in it what they ought to know, to enable them the better to exercise their Art, and undergo the Examination, which at present they are obliged to before you for their Reception: I hope likewise (Gentlemen) you will have the goodness to excuse it, though not fo fair a Form as the Matter requires. and the I do not express the Contents so perfectly as you conceive them; for I have (I confess with a little too much confidence) undertaken to open divers Secrets of Nature, which (being very abstruce, and as difficult to be comprehended) create yet incomparably more trouble to explain them fignificantly, that they may be well understood: notwithstanding, as it is often seen, that a dark Body reflects the light it receives, so likewise I hope, this small Work may (by the reflection of the Sun of your Doctrine, of which

e

t

ne n-

ur

The Author's, &c.

which I have received many Rays) enlighten the Young Chirurgeons and Midwives in the Difficulties they often meet with at Labours.

Accept then (Gentlemen) this small Production of one of your Children, who conjures you, by the Love of Fathers, (that never disown their Children, how deformed soever) to defend it against Envy and Detraction, which will never dare to attaque it, when you have vouchsafed your Protection; which is the Favour defired by

Gentlemen)

The AUTHOR to the READER.

Friendly Reader,

t-

id

all

he

Ince in the Age we live in, we see, most People are govern'd rather by Opinion than Judgment, I desire, that, if you mean to profit by reading my Book, you will read and examine it without any Critical Envy, and free from all fort of preoccupation, which may obscure your Judgment, and hinder you from acknowledging the Truth of those Things I pretend to teach, Therefore be not of their humour who condemn a Conception when they understand it not; and believe it false, because 'tis new; neither imitate fuch, who feeking alone to carp at words, neglect the sense of the Difcourse: For, even as it happens very often, that Purging, tho proper for a Disease, doth no good to a Patient, when his Body is not well prepared, and disposed for its Operation : So the Doctrine of Books, which is one

The Author

of the most wholsom effectual Remedies we have to chase away Ignorance, is wholly use-less to Mens Wits, when not disposed to receive it. I believe I may hope you'll eafily grant me this Request, because 'tis for your advantage: In the mean time, tho I defign to instruct you here in whatsoever concerns Women with Child, or in Labour, yet I would not divert you from reading other learned Authors who treat of it, but only advice you that the most part of them, having ne ver practifed the Art they undertake to teach, resemble (in my Opinion) those Geographers, who give us the description of many Countries which they never faw, and (as they imagine) a perfect account of them; which makes it very difficult (not to fay impossible) they should ever obtain their end : For 'tis certain (as Plutarch hath very well noted) that the speculative part of Arts is improfitable, and unfruitful, when destitute of the practice. You may then, as to this Subject, relie on the Method I'show you, fince, to conduct you in it, I faithfully recite what I have with very happy fuccess observed these many Years in the practice of Deliveries.

and a driffer salood to mire

to the Reader.

Furthermore, blame me not for being of a Judgment different from the common Opinion of many; for I declare I have only bound my felf to acquaint you with the truth, of which, I hope, you will have more satisfaction, and be better pleased, than if I had alwayes blindly followed the thoughts of others; having likewise endeavoured, not to extend my felf in superfluous Discourse, to the end I might be more intelligible to young Chirurgeons and Midwives, to whom this Book (if I be not miftaken) will be as useful as any, to teach them the safe practice of the Art of Deliveries. I have not ftuft it with a number of long Receipts, serving only to swell a Volumn, and confound their Wits in the uncertainty of the choice of fo many different Remedies, composed of Drugs which very often are unknown to them; but fingly contented my felf to teach them the best, and principally such as we ordinarily use in our practice. But if in all this you find fome of my Opinions not wholly Satisfactory, or others (according to your Opinion) not fully agreeing with the Truth; remember, that as amidst the best Corn, there fpring Tares, or other Weeds; so in like manner

The Author, &c.

manner you meet with few Books, whose Doctrine is so pure, as not to find something in them to reject; and if I may hope for respect from you in recompence of my pains, it will be but proportionable to what you may have for many others, who never had, in this occasion, a greater defire than my felf to render you service.

The Translator to the READER.

Courteous Reader;

Aving long observed the great want of Necessary Directions how to govern Women with Child, and in Child-bed, and also how New-born Babes should be well ordered, I designed a small Manual to that purpose; but meeting sometime after in France with this Treatise of Mauriceau, (which, in my opinion, far exceeds all former Authors, especially Culpeper, Sharp, Speculum Matricis, Sermon, Oc. being less erronious, and enriched with divers new Observations) I changed my resolution into that of translating bim; whom I need not much commend, because he is fortified with the approbation of the Wardens of the Chirurgeons Company of Paris.

His Anatomy was in the first Edition omitted, I have thought fit to add in this, with some little amendments: the rest I have, at carefully as I could, rendred into English for the benefit of our Midwives; of whom many may yet very well admit of an additional Knowledg. The principal thing worthy their observation in this Book, is, accurately to discover what is properly their Work, and, when it is necessary to send.

for advice and affiftance, that for many Women and Children may be preferved, that now perish for want of seasonable help. My Author makes out the breaknatural Delivery, and (when ever a Child is not born then, or soon after) Nature is so much short of performing her Office. This is certainly a great Truth; and all wrong Births should never be longer delayed: and for the most part Floodings and Convulsions not so long, lest the Woman lose her life before ever the Water breaks : but if no dangerous Accident interwene, in a right Labour, one may languhen out their expectation to twelve hours after; and, the fance may have been happily delivered 24 hours, or two days after, yet should I not advise any to run that has wards provided they can have an expert Artist to de liver them, without destroying the Child; because many have perished in that case; and it is not prin lent to venture, where but one of many escapes : for the longer the Labour continues after the breaking of the Waters, the weaker both Woman and Child grow, nd the drier her Body, which renders the Birth more difficult; and tis ever good taking Time by the Feretop.

And that Midwife's skill is certainly the greatest, and she deserves most Commendation, who can soonest discover the success of the Labour, and accordingly either wait with patience, or timely send for advice and belp. Nor can it be so great a discredit to a Midwife (let some of them imagine what they please) to have a Woman or Child Saved by a Man's affiftance, de ro suffer either to die under her own hand, altho dehivered : for that Midwife mistakes her Office, that

cash proposed it, by any laying the Wol cash her grincipal Dury is to take care that or Childhe well, with fafety and convenient d parted; and, if this be impossible for her, and the by another, it will justify her better to wave her ginary Reputation, and to find for help to save the Woman and Child, than to let any perish, when possible to be prevented. As in the tase of my Author's Sister, in the 20th Chapter of his first Book. Tet, in Countries and Places, where help and good advice is not feafonably to be bad, Midwives are compelled to do their best, as God shall enable them; which dangerous and uncertain trials it doth not become them to put in praetice mon Women, where no timely affistance need be Most wrong Births, with or without pain; Wife Floodings with Clods, the little or no pain, whether at full time, or not : all Convulsions; and many first Labours ; and some others, the the Child be right, if little or no pain, after the breaking of the Waters, and the Child's not following them in some six er ten hours after, requires the good advice of, and, peradventure, speedy delivery by those Physicians that are expert in this Practice: for the some few may escape in these cases, yet far the greater number perisheth, if not aided by them. Let me therefore advife the good Women, not to be so ready to blame those Midwives, who are not backward in dangerous cafes to defire advice; lest it cost them dear by discouaging, and forcing them to presume beyond their enoused or strength, especially when there are but too-

Those few things wherein I dissent from my Auhor, if of dangerous consequence, are noted in the Margent?

0

tt

The Translator

Margent; if not, are left to the discretion of the Reader.

I must confess he is in many places too prolix; a fault the French much affect; however, I chose rather to translate him according to his own stile, than contract him; and also to leave unaltered some things not very well expressed, being of no great moment. I find also that he doth not distinguish between the words Plaister and Ointment, but useth them promiseuously one for the other.

In the 17th Chapter of the Second Book, my Author justifies the fastning Hooks in the Head of Child which comes right, and yet by reason of some difficulty or disproportion cannot pass; which I confess hath been, and is yet the practice of the most expert Artists in Midwifery not only in England but throughour Europe; and bath very much caused the Report, That where a Man comes, one or both must necellarity die and is the reason why many forbear sending, till the Child is dead, or the Mother dying, But I can neither approve of that practice, nor those delays; because my Father, Brothers, and my Self [tho none effe in Europe that I know have, by God's Bleffing, and our Industry, attained to, and long practifed a way to deliver Women in this cafe, without any prejudice to them or their Infants; the all others (being obliged, for want of fuch an Expedient, to use the common way) do, and must endanger, if not destroy one or both, with Hooks. By this manual Operation may be dispatched, swhen there is the least disficulty) with fewer pains, and in les time, to the great advantage, and without danger, both of Woman

The Centernal code of the control

and Child If therefore the use of flookaby Phylicians and Chirungtons, be condemned (mithout thereto necessivated already some monthrous Rittle), we can much less approve of a Midwife's Aling them, an some bere in England books they do a minch rall, yeeland took in Erance, would salk them in question for their Lives in a soft and anon monthem and I have they are the soft and anon monthem and I have they are

In the 15th Chapter of this Book, my Author proposeth the conveying sharp Instruments into the Womb,
to extract a Head; which is a dangerous Operation,
and may be much better done by our forementioned
Art, as also the inconvenience and hazard of a Child
dying thereby prevented, which he supposeth in the
27th Chapter of this second Book.

I will now take leave to offer an Apology for not publishing the Secret I mention we have to extract Children without Hooks, where other Artists use them, which is, that there being my Father and two Brothers living, that practise this Art, I cannot esteem it my own to dispose of, nor publish it without injury to them; and think I have not been unserviceable to my Country, altho I do but inform them that the forementioned three Persons of our Family, and my Self, can serve them in these Extremities; with greater safety

I do not design this Work to encourage any to pra-Etise by it, who were not bred up to it; for it will hardly make a Midwise, tho it may easily mend a bad one. Yet notwithstanding, I do recommend it to the perusal of all such Women as are careful of their own and their Friends Saseties, there being many things in The Crandator to the Reader.

it worth their noting: And designing is chiefly for the Pemale Sex, I have not troubled my felf to oppose or comment upon any Physical or Philosophical Position or Comment upon any Physical or Philosophical Position in Alathor proposeth. I hope no good Midwives will blame me or my Author for reprehending the fault of blame me or my Author for reprehending the fault of bad ones, who are only aimed at, and admonished in this Work; and I am consident none but the guilty will the concerned and take it to themselves, which I desire be concerned, and take it to themselves, which I desire they may, and amend. र दूर्ण द्रमानामान्त्रीयर द महात्र नेपालनामुख्य लोगा है जिल Farewell.

ing on them, aligning of particularly exa-Parts of a Woman destin'd to Generation.

Ince what Hippocrates very well notes, in his Book of Humane Parts (that the Womb [immediatly, the not remesely] canfeth most Diseases in Women) is not to be doubted. I think it not amiss to premise, not only a de-

scription of the Womb, but also of every part destined to Generation in a Woman: And (according to Fernelius's Example, who forbad the Ignorant in Anatomy to read his Works) I affirm, that 'tis impossible truly to apprehend what hereafter I pretend to teach, if these Parts be not perfectly understood. I intend to be as brief upon them as I can, that Midwives may the easier reap the benefit, (being unwilling to confound b 30

them with a multitude of Anatomical Controverness for their fakes have omitted as wholly improfitable to them); however, the description I give my fuccions, hall be foreact, that joined with the Figures wherein they are represented, will sufficiently inform them how to behave themselves in the Art of Deliveries.

These parts are the Spermatick Vessels; as well preparing, as deserge, on ejaculatory, the Testicles, and the Womb, with divers others depending on them, which shall be particularly examined; and first, the Spermatick Vessels, called

He Spermatick Vessels in Women, called Preparing, because they prepare and convey to the Testicles, the Blood, of which Seed is engendred, differ not from those in Men, either in number, rise, or use, but only in their insertion, and manner of their distribution; for they, as these have two Veins, and two Arteries, arising from the same places, and doing the same Work.

These Vessels are two on each side, to wit, a Vein and Artery, the Vein on the right side ariseth out of the Trunc of the Vena Cava, and that on the lest comes ever from the Emulgent: As to the Arteries, they both spring from the great Artery under the Emulgents. The Vein and Artery being sussiciently distant in their rise join about the middle of their progress, that so they may pass together to the Testicle; but before they arrive, they produce a very considerable Branch, which descends along the side of the Womb, where they separate into three branches; of which, the first is conducted towards the bottom of the Matrix for the discharging of the Terms, when a Woman is not with Child, and for Nourishment of the Fætue in the Womb: The second, is distributed throughout the Mem-

brane of the broad Ligament, sparing also some small sions to the round Ligament: And the third branch slides along the side of the Womb, and terminates towards its Neck for to discharge the Terms, when a Woman is with Child. The other portion of the Spermanick Vessels, goeth wholly to the Testicles, and approaching the Vein and Artery are so joined, that they appear to be but one only Vessel, and another so intermixed, that they can hardly be separated from each other without breaking which is so ordered (if we believe the wulgan Opinion) that the Blood may the easier receive, in that day-rinthick Passage, all disposition, to be converted into Seed by the Passicles; before it comes to them.

Tefficles, Tefficles, Tefficles,

perfected in their Tefticles,

Small Tefticle.

CHAP.

[Our Author lying under a Mistake, in his Notions concerning the Testicles in this, and Vasa Descrentia in the following Chapter, I shall here give my sentiments of both.

We find that the Tefficles of a Woman are no more than, as it were, two clusters of Eggs, which lie there to be impregnated by the spirituous Particles, or animating Effaviums, conveyed out of the Womb through the two Tubes, called by our Author Deferent Vessels. And as he is mistaken in the Testicles, so is he likewise in an Error in his acceptation of the VVoman's Seed: For indeed there is none sent forth by the Ejaculatory Vessels (by us called Fallopium's Tubes) in costion, there being no Seed in the Ovaria, or Testicles: But some days after the impregnation of the Egg, or Eggs, as in Twins, they decide through those two Tubes into the VVomb, where being placed, the Embrio takes up its quarters.]

les and in Giod fallion farret both at ban as

Of the Deferent Vessels, otherwise called Ejaculatory.

covered but with a finele halembrane or Tunicle.

Hefe Vellels are two, falbened in their whole extent by a membranous appendix to the broad Ligament of the Womb: Nordo they procoed from the Telticles as in Men, but are distant from them, a fingers breadth at least, which canfeth them not to fuck or receive from them the Seed, but by finall Conduits almost imperceptible; which being disposed, after the manner of the Mefaraiek Veins, are trained along this membranous diffance, between the Deferent Wesfels and the Testicles. Their substance is, as it were, nervous, and moderately hard; they are round, hollow, big, and broad enough at their end, joining to the Horn of the Womb, which makes Fallopius call them Trumpers, because they fomewhat refemble the streight Trumpet wherewith Fame is usually pictured; for from a narrow end, it waxeth by degrees larger, till the other is inferted in the fides of the Womb; whereas Lauremins affures us, he hath often obferved them feparated into two Conduits, one more large and short, and opens it felf into the fide of the bottom of the Womb; and the other being narrower and longer, terminates in the beginning of its Neck, near the inner Orifice. He

He faith further. That the Women discharging their Seed by the first into the bottom of the Womb, when not with Child, which they cannot do but by the fecond when they are; forasmuch as after Conception the inward Orifice is exactly close: whence, according to his Opinion, bigbellied Women find more pleasure in Coition, than others, because the Seed is then discharged by a longer Passage. Every one (if he pleaseth) may consider this Subject further, the better to be informed of the truth of it. The other extremity of the Deferent Vellels, is not vilibly hollow, but refembling almost the Appendix of the blind Gut; nor is it fastned to any part, but is wavering and flowing from one fide to the other, and also smaller, more fluctuating and winding than the other, to the end that the shortness of the way might be recompensed by those little Windings. There may be likewise seen in the same place, four or five small membranous Productions, likewife flabby and ragged, as if they had been gnawed by Worms.

v. The rive great Line of the Prices Parts, between

Expli ation of the Courth Figure, which rethis the Wond is reprefented intire; and fe-

He Spermatick Vellets and Tellicles of Women, above-mentioned, were only made for the fake of the Womb, which is the proper place (as the Earth) appointed to receive the Seed, by (a) them prepared and perfected for it; and being there received, ferves, together with the Man's, for the Generation of a Fature. We may, with good reason, compare the Womb to a fruitful Field; for as the Seed of Plants produce no Fruit, nor cannot spring, unless sown in a Field fit to excite and awaken their vegitative virtue, affeep, and, as it were, buried in the fubitance; even so the (b) Seed of Men and Women (tho potentially containing in them the Form and Idea of all the parts of a Child to be engendred out of it) would never produce for admirable an effect, if they were not poured forth into the fruitful Field of Nature, to wit, the Womb, which having received both, embraceth them closely, and by its heat and particular properties, making use of the Spirits, with which the Seed abounds, immediatly separates the Chaos; and afterwards delineates and traceth forth all the parts of the Body of an Infant, which it perfects, nourisheth, and preserves to the full time of Labour. It

ture hath placed the Womb in the Woman's Belly, that the heat might always be maintained by the warmth of the parts furrounding it. It is feated in the middle of the

re ne ne ne ne ne

ed it, no it the es the

It

thurt by the hardness of the Bones, which form the hollowness of the Hypogastrium, and also defends the Womb, as a steady Rampart, against outward Injuries. It is placed in the lower part of the Belly, for the convenience of Copulation, and that the Fatus may the easier be extruded at the full time. In this position it hath room to be extended when the Woman's with Child; neither, is there any manner of hinderance by the Belly, which being of a sleshy substance, affords as much as necessary for the distention of the Womb.

It is of a Figure round, oblong, fomething refembling a great Pear; for from a broad Foundation which is its bottom, it terminates by degrees in the point of its inward Orifice, which is narrow. The roundness is notwithstanding a little flat before and behind, so shaped, that it should not easily waver from side to side, but be more steady in its place. When we represent the Womb of this shape, its to be understood of like principal part, being the proper Body singly, without comprehending the Neck, otherwise called the Vagina. There may be likewise

-do

observed, on the sides of this Bottom, two little Eminences, called, (c) the Horns of the Womb; because they do in some manner resemble the little Horns which begin to shoot forth in Calves.

The length, breadth, and thickness of the Womb, differs, according to the age and diffofition of the Body; for in Maids not yet ripe, itis very fmall in all the Dimensions, and in Women (who have their Terms in great quantity, and ordinarily use Copulation) itis much larger than either, in those who have them in small quantities, copulate feldom, or in Virgins. Such who have had Children, have them yet larger than fuch as have had none, and chiefly when but lately layen in ; for at that time the Worth is filled with abundance of Humors : But, in Women of a good heigth, and well shaped; the length is, from the entry of the privy Part to the bottom of the Womb, usually (d) eight inches, or thereabouts (and not eleven, as most Anatomists have written) and the length of the Body alone, is three inches, and the breadth, towards the bottom, is near the fame, and of the thickness of a small singer, the Woman not being with Child. This bottom then mounts not higher than the Os Sacrum; but when with Child, the Womb extends and becomes of a prodigeous greatness, so that in the last months it fills the greatest part of the lower Belly. Work

Almost all the famous Anatomists, as well ancient as modern, assure us, that the Womb (by a miracle of nature more wonderful than any)

becomes

becomes so much the thicker, by how much it is extended and dilated, from the time of Conception to the end of Reckoning: but I am afto nished that Laurentins Riolanus, and Bartholinus, those precious Lamps of Anatomy, should be so little enlightned in this point, as not to discover so great a falshood, but deliver it on credit, by example of their Predecessors. All those that will take the pains to examine the thing, when occasion offers (as I have done) may easily find the (e) contrary: for 'tis most certain, that the more the Womb is dilated, when impregnated, the more it becomes thin and fine, for (as Galen very well faith, in express terms, in the 14th Chapter of the 14th Book of the Use of Parts) its thickness at that time is consumed by its great extension, for which reason it becomes then vety weak; It is that which Carolus Stephanus hath also very well noted, being an expert Anatomist, whose words upon the point very well agree with Galen's, and are; Uteri substantia in principio conceptus crassa, cum autem prope tempus pariendi accedit, major quidem sed tenuis evadit, crassitudo enim in longitudinem extensa absumitur, tempore autem intercedente pro ratione magnitudinis crassitudinem habet. The Womb, faith he, is thick at the beginning of the Conception; but, when the time of Labour approacheth, it becomes truly larger, though thinner, because the thickness is wasted by the extension; and between both those times, this thickness lellens proportionably, as it extends and grows greater. Vefalius was also of the same Opiniou, with much reason, because true.

true. And as we fee the Bladder (which when wholly empty, appears to have the thickness of half a fingers breadth) becomes less thick fill, according to the quantity of Urin flowing to it, and (being totally replenished and extended) it is so thin, as it is almost transparent; and afterwards being emptied again, returns, by degrees, to be thicker in proportion, as it contracts and collects it felf: (f) Even fo the Womb, which is very thick, being empty, loofeth by degrees this thickness in proportion, as it is filled and extended when pregnant, and becomes fo thin in all its circumference, that towards the last months its almost as much extended as the Bladder, except only the place where the Burk then cleaves, and is fastned to it: for there indeed it is a little thicker and more spongious : but (g) immediatly after Labour it reallumes its first thickness, by contracting and collecting its Membranes (which, were during the pregnancy, extreamly extended) and appears at that time fomething thicker than at another, because it then contains abundance of Humors which gradually iffue forth with the cleanfings, and then it returns to its ordinary thickness. Let the World therefore be no longer deceived with this old Error, which hath almost infatuated all Men: nor believe, that the Womb is towards the last months of Reckoning, of the thickness of two fingers breadths, as Authors have imagined, being it is very true, that it is never to thin as at that time, in which it is extream thin, even as I have explicated to confirm the Opinion of Gulen; and

and Carolus Stephanis, who very well knew the

Substance, that it might the easier open to conceive; be extended and dilated for the growth of the Færm; be contracted and closed again to extrude it and the After-burden, in due time; and afterwards to retire and place it felf in its first estate; as also to expel any strange Humors which sometimes may be contained within it.

It is composed of many fimilary Parts, as Membranes, Veins, Arteries, and Nerves. It hath two Membranes, which compose the principal part of its Body, of which the outmost is the common, and ariseth from the Peritonaum; it is very thin, smooth without, and unequal within, the better to cleave to the (b) other, which is called the proper Membrane to the Womb, and is as it were fleshy and thickest of all those we meet in the rest of the Body, when a Woman is not with Child, as we have faid already: It is interwoven with all forts of Fibres, that it might be the more capable (without danger of burfting) to fuffer the extension the Child and the Waters causeth during pregnancy, and that it might the easier close on all sides after Travail.

The Veins and Arteries proceed partly from the Spermatick Vessels, and partly from the Hypogastricks. All these Vessels are inserted and terminated in the proper Membrane of the Womb; the Arteries convey to it Blood for its

nourishment; which being brought thicker in too great abundance, fweats through the Subflance of it, and diffils in manner of a Dew into the vacuity of its bottom, whence proceeds the Terms in a Woman not with Child, and the Blood which nourisheth the Fatin when bigbellied. I fay, the Arteries convey the Blood, for as much as the circular Motion, which is made continually in all living Animals, shows us, that they alone are capable of doing it, and not the Veins, which ferve only to reconduct to the Heart, the Blood which is not evacuted, after the manner aforesaid, by the Womb, nor confumed either in its nourishment, or the nourishing the Færus, when the Woman is big. Branches which issue forth of the Spermaticks, are inferted on each fide of the bottom of the Womb, and are much less than those which come from the Hypogastricks, which are greater, and bedew the whole Substance of it. There are yet some small Vessels, which arising the one from the other; are conducted to the inward Orifice, by which fometimes Women with Child purge away the superfluity of their Terms, when it happens, that they have more Blood than their Infant can confume for nourishment; which wife and prudent Nature hath fo ordered, that the Womb, during its pregnancy, be not obliged to open it felf to pass away those excrementitious Humors, which otherwise might very of

As to the Nerves, they proceed from the (i) firth pair of the Brain, which furnisheth all the inner Parts of the lower Belly with them, and is the reason it hath so great a sympathy with the Stomach, which likewise is very considerably furnished from the same firth Pair, so that the Womb cannot be afflicted with any pain, but it is immediatly sensible, as appears by the Loathings and frequent Vomitings happening to it.

There are likewise some others which arise from the Marrow of the Back, or Spinalis Medula, towards the Loins and Os Sacrum, which endueth the Womb with an exquisite sense, and inciting the Woman to a desire of Copulation, causeth to her, in the Action, a most grateful

alteration throughout her whole Body.

n

1,

e

t

e

d

if-

Over and above all these parts, which compose it, the Womb hath yet four Ligaments, which serve to keep it firm in the place, and to prevent the constant agitation, by the continual motion of the Intestines which surround it two of which are above, and the other two be low. The Superiors are called the Broad Ligaments, because of their broad and membranous ftructure, they are nothing else but Productions of the Peritonaum; which growing forth of the fides of the Loins, towards the Reins, pass forwards to be inferted in the fides of the bottom of the Womb, to hinder the Body from bearing too much on the Neck, and from fuffering a precipitation, or bearing down, as happens when the Ligaments are too much relaxed; and like-

-DEEL

likewise contain the Testicles, and conduct fafely as well the spermatick Deferent Vellels as the Biaculatories to the Wombi. The two Inferiors called Round Ligaments, take their Originals from the fides of the Womb near the Horns, whence they pass to the Groins, together with the production of the Perionaum, which accompanies them through the Rings, or Holes of the oblique and transverse Muscles of the Belly, where they divide themselves into many little Branches in form of a Goole Foot, of which some are inferted into the Os Pubis, and the rest are lost and confounded with the Membranes that cover the upper and interious part of the Thigh: And 'tis from thence that those numners and pains which Women with Child feel in their Thighs, pro-

Those two Ligaments are long, round, nervous, and big enough in their beginning, near the Matrix: Riolanus saith, that he hath observed them hollow at their rise, and all along to the Os Pubus, where they are a little smaller, and become slat, the better to be inserted in the manner aforesaid: It is by their means the Womb is hindred from rising too high. Now although the Womb is held in its natural scituation, by means of these four Ligaments, yet notwithstanding it hath liberty to extend it self sufficiently, when pregnant, for assuch as they are very loose, and therefore easily yield and obey to its distension, and therefore easily yield and obey to its distension.

Besides these Ligaments which so hold the Womb bridled above and below, it is yet fast ned, for greater surety, by its Neck, both to the Bladder and Restum, between which it is scienated, whence it happens, that if at any time it be instanted, it communicates it likewise to the neighbouring parts.

Its proper action or use consists in the receiving and retaining the (k) Seeds both of Men and Women, and to reduce them from Power into Action, by its heat, for the Generation of the Infant; it is therefore absolutely necessary for the conservation of the Species. It seems likewife, by accident, to receive and expel afterwards, the Impurities of the whole Body, as when Women have abundance of Whites; and to purge away, from time to time, the superfluity of the Blood, as it doth usually every month, by the evacuation of the Terms, when a Woman is not with Child. Now fince that, by the name of the Womb in general, we understand all that is comprised from the Privities to the bottom of it, which is the place of Conception, it is not enough that we have described all the fimilary parts of it, and examined it outwardly, but it is requifite, for a more perfect discovery, to make a description of its dissimilar parts; which are four, viz. the Bottom, the inward Orifice, the Neck, and the outward Orifice, commonly called the Privities. This is that we must at prefent examine, beginning at the Privities, because it is the Entry that must lead us into the other Parts,

Parts, that so we may the better consider the

admirable structure of it. and a belond anow

Which for our better understanding of it, we must consider divers others thereabouts, some whereof appear outwardly of their own accord, and the rest are concealed within these, and cannot be seen, unless the two great Lips are stretched asunder, and the Entry of the Privities a sittle opened. The parts appearing needs no description. The parts hidden behind, or between these, are the Clitoris, the Urinary Passage, the two Nymphes, and the four Caruncles.

The Clitoris may be observed in the uppermost part, just above the Urinary Passage, being a small parcel of little round Substances, and called

Wingerful ade

.1

I

by Fallopious, the Clitoris.

This Clitoris hardly appears in dead Corps, being very small; but it is much greater in the living, and swells and grows hard in proportion to their desire of Copulation, caused by the access of Blood and Spirits, in this Action, much in the same manner as a Man's Yard becomes erected; wherefore some have called it the Woman's Tard, judging it to resemble the Man's in some salling, as well in figure as composition; Some Women have this Clitoris very long, so, that 'tis said, some abuse it with other Women.

Under the Clitoris appears the Orifice, or Urinary Passage, which is much larger in Women than in Men, and makes them piss with a greater stream: There may be seen, at the same time, on the sides of the Urinary Passage, two small membranous Appendices, a little broader above

above than below, iffuing forth of the inward parts of the great Lips, immediatly under the Cheris. The use whereof is to cover the Orifice of the Urin, and defend the Bladder from cold Air ; Jand when a Woman pilleth they contract themselves so, by approaching to each other, that they conduct (by being joined in the bottom) the Urin-without fuffering it to spread along the Privities, and often without fo much as wetting the Lips; wherefore these small membranous Wings, are called the Nymphes, because they govern the Woman's Waters, the line. Some Women have them fo great and long; that they are necessitated to have them cut off, so much as exceeds and grow without the Lips. They are very red in Virgins, and eafily Supported; but they are lived and more fort, and pendant in those who often copulate, or have had Children build or dried or dried or dell's had

These parts being considered, we are to take notice of the inserior part of the great Notch, where (widening these Lips) appears the Navicular Dischl, formed by the conjunction of these Lips, which makes also a kind of a Fork, upon which rests the Man's Yard, when introduced into the Neck of the Womb, beginning in this place.

Afterwards in the entry of the Neck are discovered four small fleshy Eminences, ordinarily called the Caruncles Myrchiformes, one each side two, and another small one above, just under the Urinary Passage. They are reddish and pust in Virgins, and joined almost one to the other on their

(e).0h

their fides, by the help of finall tender Membranes which keep them in Subjection and make them in fome fort refemble ia Rose bud Thatf blown This disposition of the Emincles, delthe very certain mark of Wirginity; it being rivain to fearch inelle-where, orlhope to be informed of it anyigother) way goand Itis from the preffing and bruifing thefe Canualles, and foreing and breaking the little Membranes (joining them together) in the fielt Copulation, that fomesimes there (though not always) happens ian effution of Blood, afterwards they remain feparated and never recover their highre hout dole at constantly vmore and more, according as they often we Copulation, waxing flat, and almost totally defaced in those who have had Childrent by reasons of the great diftension these warts fuffer in Labour. g. A small portion of the Vagina opened, where terminates the Immard Orifice, which appears.

The fourth Figure represents the Womb of a Rabit full with eight young ones, each of which have their particular Cell to lodg in: I have observed one thing particular in the Womb of a Rabit, which is, two Inward Orifices both terminating near together in the Vagina.

The internal Medicane is very foit a in young Girly but saous frait much addicted to Copulation, and as

heres the Bronzer to the Bladder and

Of the Vagina, or Neck of the Womb.

Prehend all that long and broad membranous space couched before it, from the four Caruncles, lately described, to the Inward Orifice, and which in the Act of Generation, serves for an ante-Chamber to lodg the Man's Yard, as in a Sheath, which conducts it even to the Inward Orifice, that it may there cast forth its seed therefore it is commonly called the Va-

This

This Neck is of a membranous Substance, the better to extend it felf, for to give fufficient paffage to the Infant at its binth. It is composed of two Membranes, the innermolt of which is white, nervous, and circulary, wrinkled like the Pallat of an Ox, that it might dilate, contract, extend, or appreviate is felf, according as it is necessary to bear exact proportion with the bigness and length of a Man's Yard a and to the end that (by the collision made in Copulation) the pleasure may mutually be augmented : But the external Membrane is red and fielly like a splanters; turnounding the first to the end the Yard may be the better closed within it. Tis by means of this Membrane, that the Neck adheres the stronger to the Bladder and Restum. The internal Membrane is very foft and delicate in young Girls, but grows firmer in Women much addicted to Copulation, and at length becomes fo hard, (by often using this Trade) that old Women Have them | Grifty. almost | Cartilaginous. -mila Women who have not yet had Children this Neck is for the most part, but four kod

this Neck is for the most part, but four took inches in length, (it being almost always possible with a Finger to reach the linward Orifice of the Wombs where it ends) and an inch and half broad, or thereabouts; but in such broader and morters by which it is easier to touch the linward Orifice with a binger. Its direadth is almost all along equal, from one end to the other, without having any Hymen in the middle, as divers Author

thors would have it, who lay, That you may find there a Membrane scituated a-cross, pierced only with a little Hole, through which the Terms, and other Superfluities, should pass; which remains fo spread, that either by Copulation, or otherwise, tis forced and rent, by which one may know whether the Woman were a Virgin or not: But this is a pure Abuse, and if (as Laurentine faith very well) fuch a Menbrane be found in fome Women, it is most certainly contrary to the delign of Nature, fince they are not found in a Female Fierus (which I can very well affure you, having diffected a great number of them) no nor in any Maid of Wife, of what Age foever, who have no other mark to conjecture their Virginity by, but the disposition of those Caruncles Myrtyformes, del scribed above, and being placed at the entry of the Neck of the Womb, renders the pallage thereof more strait. Let us now fee what the fructure of the Inward Orifice is. a men w. (WOT) This Orifice whiches almost always hut, op

Of the Inward Orifice of the Womb.

The Inward Orifice, is nothing but the abutting of the Body of the Womb on the bottom of the Vagina, relembling the Muzzle of a Puppy newly pupp'd; in the midft of which may be seen a very narrow Passage, which being opened, gives way to what is fit to be received in the Womb, or to let out what is fit to be expelled. It is called the Inward Orifice, to distinguish it from the outward entry of the Neck of the Womb, which is called the Oneward Orifice. The Midwives call it the Crowning, or Garland, because it girds the Infant's Head, surrounding it like a Crown, when a Child presents to a natural birth.

This Orifice which is almost always shut, opens it self at the time of Coition, to give way for the Man's Seed to enter, which by this means is darted to the very Fund of the Womb; and likewise to let the Terms issue forth, of which it is purged every month, as also for the expulsion of falle conceptions, or any other strange Body there engendred; and altho it be so exactly close after Conception, and during Pregnancy; yet at the time of Labour it is opened so extraordinarily, that the Infant passeth through it into the World: then this Orifice wholly disappears, and the Womb seems to have but one great Cavity (equally large

like that of a Bag) from its bottom to the very entry of the Neck. When a Woman is not with Child, 'tis a little oblong, and of substance very thick and close; but when with Child, it is shortned, and diminisheth in thickness proportionably to the distention of the Womb: therefore, you must not believe Laurentius, when he affirms, that its substance waxeth thicker a little before Labour; for it is most certain, that it is then thinner than ever, and that this Orifice appears then very flat, and not oblong, as it is when a Woman is not with Child,

Towards the last | months of | Or being with

Pregnancy, 'tis indued with a flip- Chile

pery and viscous Humor, not unlike Snot, proceeding from the Waters and moiflures sweating through the Infant's Membranes, and acquiring this viscous consistence by the heat of the place, and the stay they make there, and which afterwards moistneth and sloweth down from this Orifice, then beginning, by little and little to be opened and softned by this slippery Matter; which is an assured sign that Labour will soon follow.

As to the Action, by which the Inward Orifice is opened and shut, according to several Occasions, 'tis purely natural, and not voluntary; which is not amiss: for if the motion of this Orifice depend on the Will of the Women, there would be many who would thereby hinder Conception in the use of Copulation; and there would be many wicked enough to expel and reject, at pleasure, the Seed which they have conceived.

with Claid, his ny . A A H Did of febrance

Merk. When a Worona is abt

Of the proper Body and Fund of the Womb.

A Fter an account of the Womb in general, in the preceding Lines, there remains no more to consider particularly, but that which we call the proper Body, which is the largest and most elevated principal part, in which the Conception is made. This Body extends it felf by always enlarging, from the Inward Orifice, to the Fund of the Womb; it is lodged under the bottom of the Bladder, and sustained upon the Reitum, without being fastned to the one or the other; but it is free both before and behind, to the end it might be extended and closed, when necessary: nevertheless it is in some fort head in subjection, by the help of the Ligaments of the Womb, which faften it on each side.

The Body of the Womb resembles (as already faid) a great Pear. It is round, but a little flat before and behind, that it might be the firmer in its scituation. All the exterior part of its Fund is very close and smooth, except the two sides, where may be marked little Eminencies, called the Horns of the Womb; in which place are terminated, on each fide, the Ejaculatory Vessels, and the round Ligaments are fastned. It is of a membranous substance, of the thickness of the

breadth

breadth of a good Finger, which makes the inward Cavity Imall enough, to the end it may on all lides straitly embrace and touch the Seed after

Conception.

Most part of other Animals (as may be feen in the leveral Figures represented in p. 28, 29.) have their Womb divided into two parts, a right and a left, in each of which they have as many Cells as they can bear little ones at one birth; having likewise their Waters and Ves-sels distinst, and is there involved with its particular Membranes; but that of a Womans, notwithstanding that they have sometimes several Children together, is not to disposed; for you never find there but one and the same single Cavity, in the midst of which appears a small Line, very slight, not unlike that which is feen under the Scrotum; which made Hippocrates ordinarily divide this Cavity into the right and left part, believing, besides, that the Males are rather engendred on the right. and the Females contrarily on the left fide; as in his 48th Aphorism of his 5th Book, where he faith precisely, Fatus mares dextrà parte uteri, famine sinistra magis gestantur. But to speak the truth, the Cavity is but one, in the midst of which are always naturally scituated as well Males as Females. We cannot find here those small Bminencies which he calls Coryledons, not usually found but in horned Bealts; for a Woman's is inwardly very smooth, or at least very little unequal; in the Cavity of which is nothing elle to be observed but this small Line, even now deferibed,

bed, and some the small Porce, which seem to be the Extremities of the Orifices of the Vessels, which end there, and to which the After-burthen in a Woman with Child is fastned, that it might receive thence the Mother's Blood, which (by an admirable providence of Nature) flows the ther continually, to serve afterwards for Nourishment and growth of the Infant, whilst it sojourns in the Womb.

Now having hitherto fully discovered whatever may be considered about the parts of a Woman destin'd to generation, that they may be the better understood, and may serve as a Guide and Lamp to conduct and enlighten us in the Dissiculties met with in the Knowledg and Cure of Diseases of Women with Child, and in Child-bed 'tis time to enter upon the Matter, and examine what these Maladies are, and shew the means how to manage their Cure.

The First Book.

Of Diseases, and different Dispositions of Women with Child, from the time of Gon-ception to the full time of Rechming.

Any Indispositions happen to Women from the time of Conception to the full term of Labour, being then not only subject to those caused by Pregnancy, but to those also which happen at other times. It is,

not my defign so to enlarge as to examine all but only to enquire into the principal and most usual Maladies accompanying Great-Bellies, and having during their Course, particular Indications for their Cure; for as for such which have only general Indications, and happen indifferently to a Woman at any time, they may easily be known and redressed by ordinary means, provided you have all the while regard to the Great-Belly.

It would be fufficient to my purpose of a strict.
Examining every circumstance of a Great-Belly in pursuance of my Design, to begin with the

Explication of a Conception, which must precede it: but fince that cannot happen but to a fruitfull Woman, I will, before I discourse of it, that you may the better understand its original, give you fome confiderable Observations concerning the Fruitfulness and Barrenness of Women. For Barrenness proceeds oftner from Women than Men: there being many conditions required in a Woman, of which Men have no occasion, who only need to provide a smal quantity of Seed, and that at once to generate; but Women, befides their Seed, must have a fit place to receive both, as the Womb is when well disposed; and matter appointed for the Child's. Nourishment, during its whole stay there, as the menstruous blood ! This is the cause, that for one impotent Man, there may be above thirty barren Women found. Let us therefore first see what are the signs of Fruitfulness and Barrenness in Women.

CHAP. I

Of the Signs of Fertility and Stertility in

By the Fertility of a Woman, Funderstand such a natural disposition of her Body, as by which (with the Assistance of a Man) she may engender her like: And by Stertility, which is directly contrary, I intend an Impotency, proceeding from some vice or fault either of her whole Body, or some particular part. Let therefore some enquiries after the most noted signs of the one and the

ble

the other be made, and chiefly of those perceived by our fight or touch, by which it's better judging than by many others, for the most part uncertain: For those taken from different Temporaments, may easily deceive us, for a smuch as we often find Women of a very ill habit, and full of ill Humours, notwithstanding fruitful.

part absolutely necessary to fertility, and the principal object to be represented and examined a for as every Ground is not proper to yield Fruit, and some so ungrateful as to produce nothing; so likewise it is not enough for a Woman to have a Womb to be capable of Conception; since divers that have them, are barren.

We have already shewed you exactly what the Composition and natural Structure of it ought to be, to serve to so admirable aniend as Generation: Wherefore we will now speak no further but refer you to that place to be informed of that the

Know then in general, that the figns of fecundity in Women are, that the Womb be well disposed, that she be at least thirteen or fourteen years of age, and at most but 45 or 50 generally, and for the most part (though some, yet very rarely, conceive sooner or later according to their different matures and dispositions) that they be of a good temperament and indifferent sanguine, have their Courses in due time, of good blood, and laudable in colour, quantity, quality, and consistence, and regularly every Month, at once, without interruption, from the time they begin to flow till the time the Evacuation is compleated.

We fay the Blood ought to be good and laudas

ble, because it is a Regurgitation and natural Evacuation only of what is superfluous in Women not with Child, and yet of Age capable of Concaption; which hath no Malignity in it self, as many fally imagine: for in healthful Women it hardly differs either in colour, consistence, or quality, from that which remains in the vessels, except the small alteration, caused by the heat of the place whence it proceeds, and by the mixture of some humonis with which the Womb is alwayes plentifully surnished.

The Evacuation (if in order) should be but once every Month, though fome have them every fortnight, or at the end of three weeks, according as they are more or less fanguine, cholerick, or have their blood heated : and to continue two or three days together, or fix at most, and that by little and fittle constant without interruption and also more or less according to the difference of their particular temperaments. If a Woman have few of them, as when grown in Years, the becomes barren, foralmuch as this Blood feems to nourish the Child in the Womb: And likewife if the have too many, the thereby grows too weak, and the Womb too cold. There are notwithstanding some Women who void more of them in two days, than others in eight. They must flow by degrees and without interruption, and not all at once; for great and fudden Evacuations cause great diffipations of Spirits, of which abundance are necessary for Generation; and the Interruption of thefe Evacuations hews fome Impediment in nature, or fome vice or evil disposition of the Womb.

9-

ot i-

y

n

If all these signs concur, we may very brobably judge the Woman feuitful, I fay probably because many have them all, and yet cannot conceive, though they do their endeavours, and observe thereto all the requifite and necessary circumstances hereafter mentioned. There are likewise others, who, notwithstanding they have not all these conditions, are fruitful. Now if all the above named particulars are found in a Woman barren, and you defire to inquire more narrowly, and to be informed more certainly, whether the be capable of Conception, Hippoorates teacheth a way to know it, to which I give little credit, because the reasons of it are obscure. It is in the 49 Aphorism of his 5th Book, where he faith, Si Mulier non concipiat, & scire placet an sit conceptura, vestibus undique obvolutam subter suffito: ac si odon Corpus pervadere videatur, ad nares & os ufque, non sur culpa sterilem esfe scito. If a Woman doth not conceive, and you are defirous to know whether the is capable, or no; wrap her close round with clothes, and put a perfume under her: and if she perceive the fent to pass through her body to her Nofe and Mouth, be affured (faith he) it is not her fault the is barren.

Fertility was anciently so esteemed by our fore-fathers, that they believed Barrenness to be a mark of Rebrobation; by reason of which the fruitfull Servant despised her barren Mistress; as we reade in the 16th Chapter of Genesis, where mention is made of Sarai, Abraham's Wife, who, seeing she could have no Children, and being past the Age of hoping for any, and that her Husband was displeased at it, bid him take her Ægyptian Cham-

A 3

bermaid,

bermaid, named Agar, to lie with him, that by her means she might give him lineage, which good Eather Abraham quickly did, and had by her afterwards a Son, called Ishmael; But from the time this Maid conceived, she began to despise her Mishrifs Sarai, as yet barren. The Women of dur times are not so earnest to have lineage after this fashion, there being but few that will suffer their Husbands to cares their Chamber-maids, much less charitably excite them to sollow this example, which custom is abolished amongst us.

I also admire the great passion many have, who complain of nothing with greater regret than dying without Children, especially without Sons. For my part, I believe they that descend from Casar, or the Family of Bourbons, may with some reason be led away with this superstitious and common Inclination of preserving their kind, and be vexed with these sorts of Inquietudes, no ways becoming ordinary people; though excusable, and permitted to great Monarchs and Illustrious

Men.

When we perfectly understand the natural dispositions, we may the easier discern those contrary to Nature; wherefore the signs of Fruitfulness easily teach us those of Barrenness. The signs and causes of Barrenness proceed either from Age, or evil temperature and vicious confirmation of the Womb, and parts depending on it, or the indisposition and intemperature of the whole habit. The evil conformation of the Womb renders Women barren, when the neck (called the Vagina) is so narrow, that it cannot give way to penetration; and when it is wholly or in part closed by some

fome external or internal membrane, (which is very rare, if at all) or by any tumour, callolity, or cicatrice, hindering the Woman from free

use of Copulation.

But it is not fufficient the Man's Yard enter the Vagina, the Antichamber to the Womb: for, if in the Act of Copulation, he knocks at the door, which is the internal orifice, and it be not opened, all is to no purpose. This orifice is likewise hindred from opening by fome callofity, proceeding from abundance of ill humours, which usually flow down from the Matrix, or by fome tumour happening to it; or also, by some part, which may fo compress it, that it cannot dilate to receive the Seed, as doth the Epipleon (or Cawl) in fat Women, according to the opinion of Hippocrates in the 46th Aphorism of his 5th Book, where he saith, Que preter naturam crassa, non concipiunt, iis os uteri ab omento comprimitur, & priusquam extenuentur, non concipiunt. Women exceeding fat do not conceive, because the Cawl compresseth the orifice of their Womb, neither can they till they grow lean. I do not willingly admit amongst the causes of Barrenness, this compression of the inward orifice by the Epiplion, forasmuch as Aritin hath very well remedied it, by fome of the postures invented by him, by which this orifice need not be so compressed in the Action.

The most frequent reason why this orifice opens not in this act to receive the Man's Seed, is the infensibility of some Women, who take no pleasure in the venerial act; but when they have an appetite, the Womb desirous and covetous of the

A 4

120

Seed, at that instant opens to receive, and be delighted with it. But though the Vagina, or neck of the Womb, and the inward orifice opens to give passage to the Seed; yet may they very often continue barren, if the scituation of this orifice be not rightly placed, but either forwards above

* Great, or wards the * Intestinum rectum, or right Gut. towards either side; all which hinders the Man from darting his Seed directly into it, and consequently the Woman

from conceiving.

Hippocrates feems to have noted all the figns and causes of Barrenness, which usually proceed from the evil temper of the Womb, in his 62 Aphorism of the 5th Book, where he saith, Qua frigidos & densos habent uteros, non concipiunt, & que prahumidos habent uteros, non concipiunt : extinguitur enim in ipsis genitura. Et qua plus aquo siccos & adurentes : Nam alimenti defectu semen corrumpitur. Qua vero ex utrisque nacta sunt moderatam temperiem, ea facunda evadunt. All fuch Women whose Womb is cold and thick, cannot conceive; nor they who have it too moist: because the Seed is extinguished in it. And likewise such who have it too dry and hot; because, for want of Aliment the Seed corrupts: but fuch, as are of a moderate temperament are fruitful Of all these which Hippocrates recites in this Aphorsm, the most common, according to my opinion, is the continual Humidity of the Womb, fed by an abundance of the Whites, with which many are very much inconvenienced, the humours of the whole Body being accustomed to stir their Course this way, which can can very hardly be turned away when inveterate, and the Womb being imbued with these vicious moistures, becomes inwardly so unctuous and suppery, that the Seed (the viscous and glutinous) cannot cleave to it, nor be retained within it, which is the cause it slips immediatly away, or in some short time after it is received.

Barrenness also proceeds from the whole habit of the Body, as when a Woman is too old, or too young: for the Seed of the young is not yet prolifick, neither have they the menfirmous blood; two things requisit to fruitfulness: and that of the aged is too small in quantity, and too cold; they likewife want the menstruous blood. An universal intemperature (thothe Woman be of convenient years) renders them however barren. as when they are hectick, hydropick, feavourish and fickly, and especially so much the more as the noble parts are fallen from their temperament and natural constitution. There are however many feem barren for a long time, because of some of the fore-mentioned Reasons, year till they are thirty five or forty, years old, and fometimes longer, who yet at last conceive, being cured of the indispositions which hindred them, and having changed their temperament by age, of which we have had a remarkable example in the person of Queen-mother, lately deceased, who was above twenty two years married, and without Children, and yet afterwards, to the great joy and content of all France, the had our Invincible Monarch Lewis the 14th now reigning, to whom God grant a long and happy life.

Some of these Barrennesses may sometimes be

cured by removing the Causes, and procuring the dispositions we have said are necessary to fruitfulness; yea, of those that proceed from an univerfalintemperament, by reducing thy Body with a good and convenient regimen to a good order, and this according to their respective indispositions. Wherefore if a Woman have naturally the Vagina too narrow, and not from fome of the Causes abovementioned, she ought to be joyned to a Man whose Member is proportionable, if possible: and if that will not do, (which happens very feldom) the must endeavour to relax and dilate it with emolient Oyls and Oyntments; if the neck of the Womb be compressed by any Humour, it must be resolved and suppurated according to its nature and scituation, having always care to prevent the Corruption of these parts, which being hot and moift, are very fubject to it; because the Womb serves as a sink by which all the ill humours of the Body are purged; fo that you must take great care, that these kind of Tumours turn not to a Cancer, which is a very mischievous malady, and causeth the poor Women miserably to languish which are afflicted with it, and which after many insupportable pains, brings them almost always to an inevitable death.

When the Vagina is not clear in its capacity, because of any scar after a rent, caused by some force or violence to the Woman, or of some hard labour, or after an Ulcer, which caused the two sides to be agglutinated, whether inwardly or outwardly, it must be separated the hest

best that may be with a * Bistory, or some other Instrument, ac- * A kind of large cording as the case requires, Incision Knife. hindring, by interposed Linen, that it do not again agglutinate.

When a Woman hath no Vulva, or outward entry of the Womb pierced, which is very rare, it must be opened by making a long Incision.

Fabricius recites the like case in a Girl of thirteen years of age, like to die of it, because her Terms could not come down, there being no perforation, wherefore he did the like operation, which fucceeded very well, and made her by that means capable of generation. As to the inward orifice of the Womb, if it be displaced either towards the back or fides, it may be in fome fort remedied, by making the Woman to observe, in the act of generation, a convenient posture, that the Man's Seed may be ejaculated toward the orifice; and if the Whites, or other impurities of the Womb cause Barrenness, as it is for the most part by the discharge of the whole habit on this place; it must be helped by Evacuations, Purgations, and a regular Diet, according to their different Causes, and qualities of these ill humours.

Having thus discovered the most certain signs of Fertility, and the marks of Sterility, I will now (the better to pursue the order I have pro-

Woman neither hath por can yelld Seed, a great abfurdity to believe: for the contrary may callly

posed) treat of Conception.

alit .

cq AHD wal, by feether the Spermatick Veffels and Tetucius of a finitful Wousen appointed for

drive od vian lant decenin

or fome other inframent of H. A. Fried of lago

Of Conception, and the conditions neceffary forit.

T is most certain, according to the Rule of Natures that a Woman is incapable of conceiving, if the hath not the conditions requifit for fruitfulnefs: we have mentioned them in the foregoing Chapter : lesusinow examine in this, what is Concaption, and how caufed! Conception is nothing clie but an action of the Womb by which the prolifick Seeds of the Man and Woman are there received and retained, that an Infant may be ingendied and formed out of it. There are two forts of Conceptions; the one true according to Nature, to which fuceceds the generation of the Infant in the Womb: the other false, which we may fay is wholly against Nature, and there the Seeds change into Water, False-conceptions, Moles, or other ftrange matter.

The qualifications requifit for a Woman to conceive according to Nature, are, that the Woman receive and retain in her Womb the Mans and her own prolifick Seed, without which it cannot come to pass; for it is necessary that both feeds should be there. Nor is it at all true what Aristorle and some other of his followers affirm, that the Woman neither hath nor can yeild Seed; a great abfurdity to believe: for the contrary may eafily be discoverved, by seeing the Spermatick Vessels and Testicles of a fruitful Woman, appointed for

this

THE TANK

this ufe, which are wholly filled with this Seed. which in coition they discharge as well as Men. Such as will not open their eyes to behold a verity fo clear, may make reflection on the refemblance of Infants to their Mother which could not be unless her Seed had been more predominant than the Father's, when he begot them; which likewife happens after the fame manner when the Father's hath more force and virtue. Which may evince that the Woman's Seed contributes as well to the formation of the Infant as the Rathers', 1f they will not agree to a thing fo common, let them make another reflection on the generation of certain Animals, participating of the Nature of the Male and Female (of which they are engendred) tho of different kind; as we daily lee Alles and Mares produce, by their coupling, Mutes, Animals of a middle nature refembling the one and the other, that produced them. We may then learn by this, that both Seeds are necessary for a true Conception, provided they be prolifick, that is, containing in them the Idea of all the parts of the Body, and then the Womb being greedy of it, delights it felf in it, and easily retains it when received, elfe it foon afterwards rejects it.

It is not absolutely necessary, that both the Seeds be received and retained intire, without the loss of some part; for, provided there be a moderate quantity, its sufficient: Nor must we imagin, that (though all of it be not received into the Womb) the Child, formed out of it, will want some Limb, as an Arm, Leg, or other member, for want of sufficient matter: inasmuch as the some ling faculty is whole in every part of the Seed, of

which

which the least drop contains in it potentially the Idea and form of all the parts, as we have lately made appear; but indeed when the Seeds are received but in small quantity, the Child may be the less and weaker for it: Or, if either, or both of them have not the requisite qualities; or, though well enough conditioned, if the Womb be imbued and stuft with ill humours, as the menstrues, whites, and other filth, or fault; if then there be a Conception, it will be contrary to Nature, and there will be ingendred false births, Moles, or Dropsies of the Womb, mixed with some other strange Bodies, which are very troublesome to Women, till they youd them.

blamed, when their Children are born with red and livid spots, which very much disfigure the faces of some of them: it is usually said but with out reason) that this proceeds from the Mothers longing to drink Wine; for though some have, by chance, been in effect harrassed (as they affirm) with these passionate desires during their being with Child, yet we must not superstitiously believe (as many do) that these Spots are so caused, but rather from some other cause, which must be search'd for elsewhere: And that

*No good which makes it appear, it cannot reason. proceed from hence, is, *that almost throughout all Italy, where nothing but White-Wine is drunk, as also in Anjoy in France, I have seen divers persons marked with these red spots: and in case it proceeded from their Mother's longing to drink Wine, they ought to be white spots, or of an Amber colour, being

the colour of the Wine of these Countries : but we ought rather to conclude that they are caused from some extravasated blood, at the time the Infant is formed; which marks the Skin, yet very tender with these spots, and colours it in whatfoever part it toucheth, much after the same manner as we fee it marked with Gunpouder, or fome Waters producing the like effect, when it is wash'd and bathed with them. I will not however deny that the imagination hath a power to imprint on the Body of the Infant Marks of this nature; but that can only be when young with Child, and principally at the very moment of conception; for when the Child is compleatly formed, the Imagination can in no wife change its first figure; and Women must wean themselves from these vain apprehensions, which they fay they have to fuch things (every moment) and ferves some of them for a pretext to cover their liquorishness.

Since my discourse is fallen on this subject of Marks, with which oft-times the Bodies of Infants are spotted in their birth, and comes, as is ordinarily believed, from the Imagination of their Mothers, it feems to me not much from my purpose to recite a circumstance very particular, found on Me when I came into the World, as my Father and Mother have often told me, which is that my Mother being with Child of me, and almost at the end of her Reckoning, as it appear'd afterwards, the eldest of her three Sons (which she then had of fix years old, and her first-born, whom she loved with an extraordinary tenderness and passion) died in feven days of the Small-Pox. all which time the continued night and day by his Bed-fide, tending.

tending him in all his necessities, not suffering any other to do it, what foever defres were made into her, not to weary and trouble her fell as the did, for the Child's lickness, alledging that in her prefent condition the ought to be careful of her felf, and not be the caule of death to the lufant the went with; in fine, at the end of feven days her Son died, upon which the next day the was delivered of me, who brought effectively into the World with me fix or feven of the Small Pox.

Now it is certain, that it would be * irrational to fay, that I had then congracted these Small Pox in my Mother's Womb, by her Itrong Imagination: But if I were asked whence they proceeded? I should answer, that the contagious air she breathed, without discontinuance, during the whole fickness of her deceased Son, had so infected the mais of her Blood, with which at that time I was nourished, that I, rather than she, easily received the imprellion of this Contagion, because

contrary.

of the tenderness of my Body. tLet TExperience is therefore affert, that the Imagi-(hews the nation cannot produce any of the above mentioned effects, but at the moment of Conception, or within

few days after, and that we ought for the most part to fearch elsewhere (if we delire the truth of it) the cause of most of these Spots, Marks. and Signs with which many Infants are born.

histic H A:P. III. Ward out both

the to nice and loop is not good : but it is not fo in

Of the signs of Conception.

A Sit is very hard and belonging only to expert A Gardiners to know Plants as soon as they begin to spring forth of the Earth; so likewise there are none but expert*Chirurgeons can give a woman certain as *Chirurgeons urance of Conception from its be only practise inning: althosome of these signs, Midwisery in resembling those of the suppression of the Terms and other Mala-

lies in Women, cause many to be deceived in it. I will not trouble my self to make a recital of a great number of signs of conception, which rather tend to superstition, than an effective verity: but only the most essential and ordinary, by which a Chirurgeon may be assured of it; of which some may presently be perceived, others not till afterwards. He may first examine and inform himself, whether the Woman hath all or most part of the signs of fertility, already named in the discourse of them, if not, he must impute them to some other tause; and supposing her fruitful, you may then know whether she have conceived, by this agreement, and more than ordinary delight in the act.

It is not enough for a Woman to be certain she hath conceived, and to yeeld and receive her Seed with the Man's into her Womb, unless it close at that instant, and retain it. There is an Article amongst the customs of Paris, in which it is said,

that to give and keep is not good: but it is not so in Conception; for a Woman gives and casts her Seed into her Womb & there retains it. She may know whether she retains the Seeds, if she perceives nothing flow down from the Womb after Copulation: the Woman some few months after perceives also a small pain about her Navel, and some little commotions in the bottom of her Belly, caused by the Womb's closing it felf to retain the Seeds, and contracting it felf so as to leave no empty space, the better to contain them, and embrace them the closer. The light pain of the Navel comes from the Blader of the Urine (from the bottom of which proceeds the Uracus, fastned to the Navel) which is a little agitated by that contraction and kind of motion that happens to the Womb, when it is closed to retain the Seeds, and from the like agitation comes also those little commotions of the Belly.

These are the figns of Conception, which may be known at the moment it happens, and yet more certainly if you perceive the inward Orifice exactly close. Besides these signs, there are others that cannot be known till some time after, as when she begins to have Loathings, having no other Distemper, loseth her appetite to Meats which she loved; longs to eat strange things, to which not accustomed, according to the quality of the humours predominating in her, and with which her stomach abounds: She hath often naufeatings and vomitings, which continue a long time: the Terms stopping, no other cause appearing, having always before been in good order : her Breasts swell, was hard, and cause pain,

from

from the flowing of the blood and humours to them, wanting their ordinary evacuation, their Nipples are firmer and larger, because of therepletion; the Navel starts: her Nipples are very obscure or dark coloured, with a vellowish livid circle round about: her Eyes are dejected and hollow, the whites of them dull and troubled : her Blood, when she hath conceived some time, is always bad, because the superfluities of it not being then purged, as accustomed, is altered and corrupted by their mixture. Moreover, there is a fign, which all the Women esteem and hold in this doubtful case for very certain, which is, en ventre plat enfant y a, in a flat Belly there is a Child. Indeed there is rime in this proverb, and fomething of reason, but not as they imagine, that the Womb closing it felf after Conception draws in a manner the Belly inwards and flatten's it: which cannot be; because the Womb is free and wavering, not fastened forwards to the Belly. whereby to draw it back after that manner: but it may possibly be by reasonWomen grow lean by the indifpolitions of their pregnancy, and wax thinner and smaller, not only in their Belly, but also throughout their whole body, as may be known the two first months of their pregnancy, during which time that contained in the Womb, is yet very small; but when the Woman's blood begins to flow to it in abundance, then the Belly waxes daily bigger and bigger afterwards, until her Reckoning be out.

All these signs concurring in a Woman who hath used copulation, or the most part of them together and successively, according to their sea-

B 2

fors; we may pass judgment, that the hath conceived, notwithstanding many of their may happen upon the fapprellion of the Terms, which usually produce the like: for every one knows, that it canfeth allo in Virgins, diffults, naufeat ings and vomitings, but not fo frequently, the fwelling, hardness, and pains of the breaks, as alfor extravgant appetites, a livid colour of the Eves, and others, to which you must have regard. The Matrix may be yet exactly close, and the World not conceived : Yea there are forme, in whom they almost never open, unless very little to give pallage to the Terms, which happens to colloney proceeding from an Uker or other mamagnie VBH

If all these signes of Conception (which somefurles may deceive us, though rarely, if when they concur) do not give us a sufficient assurance of it, but that we defire abetter, Hippocrates teacheth its a way to know it, which I believe to be no more certain than the reft: it is in his 42d Aphorifm of his 5th Book, where he fpeaks in this fort. Si velis noscere, an conceperit mulier, dormiture, aquam mulfam fot ut dato: & si ventris tormina pariatur, concepit; fin minus, non concepit: If you defire to know whether a Woman hath conceived or no. give her, going to reft, a draught of Metheglin; and if afterwards the feels pains in her Belly, caufed by wind, the hath conceived; if none, the hath not, as he faith. Which is grounded (as I believe) apon the Supposition that Metheglin breeds wind, which cannot pass easily downwards, because the Womb (being full) compresseth with its greatness the

the * Intestin rectum, on which it is scituated and causeth those winds to *The grea rumble, which are constrained to re- Gur. covi back into the other Intestines.

Wherefore

If there be any occasion where Physicians or Chirurgeons ought to be more prudent, and to make more reflections upon their Prognosticks foran affair so important as this is, it is in this which concerns their Judgments as to Conception and Women being with Child, to avoid the great accidents and misfortunes, which they cause who are too precipitate in it without a certain knowledge. The faults committed through too much fear at fuch a time are in some fort excusable and to be pardoned; but not those caused by temerity, which are incomparibly greater. There are but too many poor Women who have been caused to miscarry by Medicines and bleeding, not beleiving they were with Child, which are so many murders they are guilty of who caused it, either through ignorance or rafhness: besides the death which they bring to those little innocent creatures, by destroying them in their Mothers Belly, they often thereby put the Mothers into great danger. We have lately had in Paris, in the year 1666, a miserable example of this kind, in a Woman hanged, and afterwards publickly diffected, near the Kitchen-Court of the Louvre, who was found four months gone with Child, notwithflanding the report of fuch persons as visited her by the Judges Order before her Execution, who affirmed contrary to Truth, that he was not with Child. They were deceived, because the Woman had her monthly Courses, though with Child.

Wherefore 'tis not fit to be too confident, forafmuch as there are many with Child who have their Courses; and I have known some who have had them all the time of their Great-Belly till the fifth or fixth month, which happens according to the Womans being more or less sanguine; though the greatest number usually have them not: but there are very few general rules which may not

fometimes be excepted against.

This accident made fuch a noise in Paris, that it quickly came to the knowledge of the King and all his Court, who very much blamed them, that by their ignorance had caused the precipitated Execution of this poor unfortunate Creature, with whom perished the Infant, innocent of the Mothers Crimes. Nor must the Chirurgeon much trust to what these fort of Women may tell him concerning it : for, being afraid of the punishment of their crime, to delay it, do almost all say they are with Child, which is a reason very confiderable, why the persons to whom such mat-ters are committed, should be very knowing. There are yet another fort of Women, who having been ill treated, fend for the Chirurgeon that he may give them a Certificate, the better to be revenged on their adversary; which that they may the easier obtain, they also affirm themselves with Child, and having received blows on their Belly, feign they feel great pain, and if by chance they have at that time their Courses, they endeavour to perswade it is a flooding, or showes, wherefore he must be careful not to be deceived: and yet, that he may not be esteemed ignorant, nor fall into the like diffrace, when there is any cause

cause of doubt, it is better to delay a little, than rashly to pronounce his prognostick at a venture. For as there are Women who would be thought. to be with Child, though they are not; fo there are others who will deny it, till they are brought to bed, as in this following Example. About the year 1654 being in the City of Saumur, there was near my Lodging a young and very handsom Daughter of a Citizen, who was five whole months under a Physitian's and Apothecaries hands, to be cured of a Dropfie which she complained of: at length after the had taken many violent Remedies they had ordered her, she was cured in a moment, by bringing forth a Child at its full time, notwithstanding all they had given her; which much astonished the Physician and Apothecary to be fo grofly deceived, in trufting to the Maid's relation, who counterfeited the Dropsie fo well, that they could never perceive the truth till she was brought to bed.

Some Women themselves are deceived in their being with Child, as lately the Wife of a Counsellour of the Court, who after having been in a course of Physick six or seven whole months for the Dropsie, under an eminent Physitian, was at

length brought to bed of a Child.

I know another Woman, a Timber-Merchant at Paris, who never had a Child, though she so passionatly desired it, as to be at the point of hoping for one at 55 years of age, under the colour that she had still her Courses. This Woman was once perswaded (upon the recital of such signs as she said she had) for the space of ten whole months, that she was with Child, of which the B4 Midwise

Midwife and many others affired her, and the her felf likewise believed ic (for it is cane to be perfwaded to believe what one hopes for with a ftrong passion) she had a big-belly, and faid also, that the felt the Child ftir; and believed it to truly, that finding her felf one day worse than ordinarily (after having prepared very fine necessaries for the Child she imagined she went with) she sent for the Midwife, who when she was come, assured her it was her Labour : but the next day (having always till then expected a Child) she voided only a quantity of Water, with some Wind from the Womb, and nothing else : after which she was forced to fold up her fine Toilets again which she had provided. By these Examples we may learn not to be too ready to rely upon Womens Relations, if there be no Reason for them; which may be known by the Examination of the Signs already. declared.

Now fince after Conception (of which we have just done speaking) there follows Generation, let it be considered what it is and how it is perform'd.

CHAP. IV.

What Generation is, and what is necessary to it.

T is a very great Truth, and generally known, I That what foever is in this lower World, is fubject to corruption, and at length confrained to fuffer death: which hath obliged Nature, provident and careful of its preservation, to endue all things things with a certain desire of eternizing themfelves, which being impossible in individuals, because mortal through an indispensible necessity, is therefore done by the propagation of their forms and kinds. She obtains her end, in respect of Animals, by the means of Generation successively reiterated: for so all creatures seem to immortalize themselves, in some sense, by producing their like. And Fathers imagine themselves not quite dead, if they leave their like behind them after

their death, to wit, their Children.

By Generation, we understand generally, a progress of that which is, to that which it is not. But this definition is a little too ample for to difcover what we defire concerning Generation of perfect Animals, and chiefly of Mankind : wherefore that our intention may be the easier conceived, we must search some other, or rather a description, which may more exactly discover the thing: to this purpose we may fay that by the generations of Mankind, we mean a proper and particular action of the Womb; by which working upon both Seeds there retained, it forms and shapes a body out of them, composed of divers parts, which it disposeth in order, to become in time the Organ of the Soul, which *This not al-

must be infused into it. There are many things requisit to make Generation perfect, without which it would be wholly and absolutely im-

possible: there are usually three principally reckoned, to wit, diversity of Sex, congression, and mixture of both Seeds. Which we will a little particularly examine, although some define

lowed by all Philosophers.

a Woman to be an Animal which can engender in it felf, and that this may be true; yet it is most certain, that she cannot ingender without a Man to discharge his Seed into her Womb. And though we daily see Pullets lay Eggs, and other Fowl, without Cocks treading them; yet those Eggs there will never become Chickens, because the Male never made an impression on them, nor gave them this polifick virtue, absolutely necessary to this purpose. Which may convince us that diversity of Sex is necessarily requisit, as well to those Animals, as to the more perfect Man.

Diversity of Sex would profit little, if copulation did not likewise follow; though some subtile Women to cloak their shamefulness, endeavour to perswade that they were never touch'd by Man to get them with Child, as she, mentioned by Averroes, who conceived in a Bath wherein a Man had wash't himself a little before, and spent his Seed in it, which was drawn and suckt in (as he saith) by the Womb of this Woman: but this is

a story fit to amuse little Children.

Now to the end these different Sexes should be obliged to come to this touch, which we call Copulation, besides the desire of begetting their like, which naturally incites them to it, the parts of Men and Women destined to Generation, are endued with a delightful and mutual itch, to stirthem up to the Action, without which it would be impossible for a Man (so divine an Animal) born for the contemplation of Heavenly things, to joyn himself to a Woman, in regard of the uncleanness of the parts, and of the act: and on the other side; If Women did not think of a thoughand

fand pains and inconveniences which their great Bellies cause them, of the pains they endure, and the hazard of their lives when they are in labour; to which may be added the loss of their beauty, which is the most precious gift they have, and makes them beloved by those that possess them, certainly it might also affrighten them from it: But neither the one-nor the other make these respections till after the action (whence comes the saying Post coitum omne animal triste) considering nothing before but the mutual pleasure they receive by it. It is then from this voluptuous Itch, and the desire of begetting their like, that Nature obligeth both these Sexes to this congression.

As to the mixture of both Seeds; it is certain that the diversity of Sexes and their congression, are only to this end, without which Generation cannot be; tho some would have Womens Seed serve to no purpose; yea, that they neither have, not eject any, as Aristotle saith: but we have proved the contrary in the Chapter of Conception, by the example of daily Experience, to which you

may have recourse, to avoid repetition.

All these three Cirrumstances, to wit, the diversity of Sexes, congression, and mixture of their matters, called Seeds, must precede Conception, to which succeeds Generation, on this fashion: As foon as the Woman hath conceived, that is, hath received and retained in her Womb the two prolifick Seeds, it is every way compressed to imbrace them closely, and is so exactly closed, that the point of a Needle (as saith Hippocrates) cannot enter it without violence; after which it reduceth by its heat, from power into action, the severy

ral faculties, which are in the Seeds it contains, making use of the Spirits with which these frothy and boyling seeds abound, and are as instruments wherewith it begins to trace out the first lineaments of all the parts, to which afterwards (making use of the menstruous blood flowing to it) it gives in time growth, and final persection.

Generation may be divided into three different feafons, the beginning, middle, and the end. The beginning is, when no other matter is in the Womb but the two Seeds, which continue fo to the fixt day, as Hippacrates notes; and calls them for that time the Geniture, as much as to fay, from whence Generation must proceed: he speaks of it in his Book De Natura Pueri, and faith, that by the experience he brings of it, one may judge of the other times. He relates a story of a Woman, which at fix days end cast forth, with a noise at once out of her Womb, the Seeds she had conceived, refembling a raw Egg, without a shell, having only the small skin over it; or, to the abortive Eggs, which have no shell: which little membrane was on the outfide a little coloured with red, and involved in it this Seed, which was of a round figure, in the internal part might be feen white & reddish fibres, with a thick humour, in the midst of which was found something like the umbelick vessels. Hippocrates calls this first time of generation, Geniture, as is already mentioned, during which time neither figure nor distinction can be observed, but only some beginning of a dispofition to receive the form of the parts; after which follows the fecond time, beginning where the first ends, that is, at the fixth day, and lasts

to the 10th. The time that the fame Hippocrates affires us the Males are compleatly formed, and the Females not till the 42d. After the first fix days are past, and the Womb hath wrought, according as we have explained, upon the Seeds, which are there yet without any mixture of blood the disposed to receive it; it is brought thither, in some fooner, in some later, according to the Woman's being nearer or further from her time of having her Courfes when the conceived. which produceth effects according to these different dispositions : for if they flow too foon, or in too great abundance, as it befalls such as con-ceive at the point of having their purgations, the Seeds are drowned and corrupted by it, which often caufeth a flooding, or at least the generation of a falfe-conception; but if they are far from their having them, the Conception is fo much the more stable. Now then this blood distilled by little and little into the Womb of the Woman, who hath fometime fince conceived, ferves as a fit matter to form and figure out all the parts of the Infant, only traced out by the Seed; and yet doth it (according to my opinion) much like a Painter, who after he hath drawn the out-lines with a chalk upon his cloth, begins to lay colour upon colour, to paint by degrees all the parts of the person whose Picture he draws. Some little space after the beginning of this second time, appears as it were the figure of those three bubbles. of which Hippocrates speaks, or rather three malles of this matter, which grofly represent the three parts, called principal; the first composeth the Head; the second, in the middle, the Heart;

and the last the Liver: there may be likewise seen the after-birth, with the umbilick vessels fast-ned to it, and the Membranes which wrapt up the whole; after which from day to day all the other parts of the Body are figured in such sort, that at thirty days end the Males are compleatly formed, and the Females the 42d day ordinarily, which is about the time the Fatus begins to be animated, though as yet there is no sensible motion.

Hippocrates feems by these different terms to be of an opinion that the Males have fooner life than the Females, because (he faith) their heat is greater: but for my part I do not believe the Male is fooner formed than the Female, and that which so perswades me, is, because, if it was so, the Male must likewise be at its full term sooner than the Female, proportionable to the same time, that the one is animated fooner than the other; which wee fee the contrary, in that Women are brought to Bed indifferently both of Sons and Danghters at the ordinary term of nine months. Therefore towards the fifth or fixth week, as well Males as Females, have all the parts of their Body (though small and very tender) intirely formed and figured, at which time it is no longer than a Finger, and from thence-forwards, which is our third time, the blood flowing every day more and more to the Womb (not by Intervals, as the Courses, but continually) it daily grows bigger and stronger to the end of the ninth month, being the full term of ordinary labour. Having explicated Conception and Generation, let us now confider Pregnancy, and the feveral forts.

CHAP. V.

Of Pregnancy, and the different sorts; with the signes of the true and false great Bellies.

THE great Belly of a Woman properly taken, is a Tumour caused by an Infants scituation in the Womb. There are natural great Bellies, containing a living Child, and these we call true; and others against Nature, in which, instead of a Child, is ingendred nothing but strange matter, as Wind mixed with Waters, which are called Dropfies of the Womb, False-Conceptions, Moles, or Membranes full of blood and corrupted Seed; for which reason they are called false great Bellies. We have already treating of Conception and Generation, mentioned the Causes and Signs of a great Belly in its beginning, notwithstanding we will again repeat the most certain and ordinary of them, as naufeoufness, vomittings, loss of appetite to things the Woman was accustomed to eat and like; longings for strange and naughty things; suppression of the Terms, without Feaver or Shiverings, or other cause; pains or swelling of the Breafts; all which may be found in Virgins, by the retention of their Courses: but the most certain is, if putting the Finger into the Vagina, you perceive the inward Orifice exactly close, as also the distention of the Body of the Womb considerable, more or less, according to the time the Woman is gone with Child, and the Child's stirand the last the Liver: there may be likewise seen the after-birth, with the umbilick vessels fast-ned to it, and the Membranes which wrapt up the whole; after which from day to day all the other parts of the Body are figured in such sort, that at thirty days end the Males are compleatly formed, and the Females the 42d day ordinarily, which is about the time the Fatus begins to be animated, though as yet there is no sensible motion.

Hippocrates feems by these different terms to be of an opinion that the Males have fooner life than the Females, because (he faith) their heat is greater: but for my part I do not believe the Male is fooner formed than the Female, and that which so perswades me, is, because, if it was so, the Male must likewise be at its full term sooner than the Female, proportionable to the same time, that the one is animated fooner than the other; which wee fee the contrary, in that Women are brought to Bed indifferently both of Sons and Danghters at the ordinary term of nine months. Therefore towards the fifth or fixth week, as well Males as Females, have all the parts of their Body (though fmall and very tender) intirely formed and figured, at which time it is no longer than a Finger, and from thence-forwards, which is our third time, the blood flowing every day more and more to the Womb (not by Intervals, as the Courses, but continually) it daily grows bigger and stronger to the end of the ninth month, being the full term of ordinary labour. Having explicated Conception and Generation, let us now confider Pregnancy, and the feveral forts.

CHAP. V.

Of Pregnancy, and the different sorts; with the signes of the true and false great Bellies.

THE great Belly of a Woman properly taken, is a Tumour caused by an Infants scituation in the Womb. There are natural great Bellies, containing a living Child, and these we call true; and others against Nature, in which, instead of a Child, is ingendred nothing but strange matter, as Wind mixed with Waters, which are called Dropfies of the Womb, False-Conceptions, Moles, or Membranes full of blood and corrupted Seed; for which reason they are called false great Bellies. We have already, treating of Conception and Generation, mentioned the Caufes and Signs of a great Belly in its beginning, notwithstanding we will again repeat the most certain and ordinary of them, as naufeoufnefs, vomittings, lofs of appetite to things the Woman was accustomed to eat and like; longings for strange and naughty things; suppression of the Terms, without Feaver or Shiverings, or other cause; pains or swelling of the Breafts; all which may be found in Virgins, by the retention of their Courses: but the most certain is, if putting the Finger into the Vagina, you perceive the inward Orifice exactly close, as also the diffention of the Body of the Womb confiderable, more or less, according to the time the Woman is gone with Child, and the Child's stirring

ring in the Womb, these give us indubitable proofs of it, we should be always careful not to be deceived by what we feel ftir in the Womb, forafmuch as the Infant of it felf hath a total and a partial motion; the total is, when it removes the whole Body, and the partial is when it moves but one part at a time, as Head, Arm, or Leg, the rest of the Body lying still: but the Woman blown up in fits of the Mother, yea and some Moles have by accident a kind of total motion, but never a partialone. That of a Mole is tather a motion of falling down than otherwise, as heavy things fall downwards: for a Woman who hath a Mole of any bigness considerable, whatsoever side the turns her felf to, her Belly falls immediately the fame way, like a heavy bowl. About the time (or very near) when the Infant quickens, if the Woman be certainly with Child, these humours (which are carried to the Breafts by the stoppage of her Courses) are turned to Milk, which when it happens, is usually an affured testimony of Pregnancy; though some Women have been found with Milk in their Breafts (but rarely) and yet not with Child, nor ever having had any: which Hippocrates also confirms in his 39th Aphorism of his 5th Book, where he faith, Si mulier qua nec pragnans, nec puerpera est, lac habit, ei menstrua defecerum. If a Woman hath Milk in her Brealts. and is neither with Child, nor ever had any, it comes from the stoppage of her Courses. But this is rather Whey than Milk, not having the confiftence as the Milk of a Women in Childbed, nay the Milk of a Woman with Child is yet but waterish, and becomes neither thick nor very white, till

till after Labour, the begins to Suckle her Child The Infant moves it felf manifestly about the fourth month or fooner or later, according as it is more or less strong: some Women feel it from the fecond, others about the third month, yea some before that time. In the beginning these first motions are very small, and very like to those of a little Sparrow when first hatch'd, but grow greater, proportionably as the Infant grows bigger and stronger, and at last are so violent, that they force the Womb to discharge it self of its burden, as in Travail. The common opinion is, that the Males quicken before the Females, because their heat is greater, but that is almost equal; for there are some Women perceive their Daughters, others their Sons foonest, which happens indifferently to Males and Females, according as there was a more or less vigorous disposition at their Generation. Very often Women who daily use Copulation, are subject to be deceived; for they usually believe they are with Child if their Courfes ftop, and withal are a little qualmish, which is not always true : for False-Conceptions cause almost the same accidents as true; and cannot easily be distinguished but by the consequences. This false great-belly is, as we have already said. often caused by Wind, which blows up and distends the Womb, and which Women oft-times discharge with as much noise as if it came from the Fundament: fometimes it is nothing but Water gathered there in fuch abundance, as some have been feen to void a pailful without any Child; though they verily believed they were with Child, as did that Wood-Merchant, whose ftory

flory you have in the end of the third Chapter. who did not void it before the end of the feath month, till when the always believed her felf with Child. There are others who conceive only falle-Conceptions and Moles, which may be known by the Infants different motions, already mentioned, and by the Moles continuing in the Womb often after the ordinary time of Labour, fome Women having them a whole year, yea many years, according to these Moles, are more or less adhering to the inner parts of the Womb, and are there entertained and nourished by the blood that flows thirher.

Moles always proceed from fome Falle-Conceptions, which, continuing in the Womb, increase gradually there by the Blood that flows to them: if the Womb expels it before two months. it's call'd a Falle-Conception, and fome are only but as it were the Seed involved in the Membrane. like that geniture which that Woman voided after fix or feven days, of whom Hippoorates speaks in his Book. De natura Pueri. The others are a little more folid and fielly, refembling in some fort the Gizard of a Fonl, and are greater or lefs, according to the time they flay in the Womb, and also according to the quantity of Blood with which they are always foaked. Women expel these False-Conceptions sooner or later, according as they cleave to the Womb, which makes them almost always flood in great quantity at those times.

It is of great importance to distinguish well between a true and a false Belly; for the faults committed by mistake, are ever very confidera-

ble :

ble i forafmuch as in a true great Belly the Child ought to continue in the Womb, he or short has been been till Nature * expels it by a naw * This excludes tural Labour but continuity not chrt to affift the falle great Belly indicates w Nature, if not a tous, the expulsion of what it ble to perform its contains as foon as may be induce from Wherefore we ought to be ver found a gainest ty careful and of bluod off he believes be a duty induced.

found the inward Orifice of the Womb dilated A S Prodence is necessary to enable a Chicurgeon or Midwife to affure a Woman that the is with Childs or not, and of a true or false-Conception fo it is likewife as much for them to know how far the is gone, to the end they may be certain whether the Infant be yet quick or no. which is of great moment : because, according to the Law, if a big-bellied Woman miscarry by a Wound, he that ftruck her deferves Death, in case the Child were quick, otherwise he is only condemned in a pecuniary punishment : they ought likewise to take heed lest they cause the death of the Infants, and fometimes of their Mother, by halten- *by Medicines. ing * their Labour before its time, imagining that when a big-bellied Woman complains of great pains in her Back and Belly. they are pains of Labour, and instead of endeavouring

vouring to hinder they contrarily provoke them. and cause to miscarry infortunately before their time. I knew a Woman called Martha Roles, being fix months gone with Child, or thereabouts, was furprized with great pales much like throws of Labour, which made her fend for her Midwife, who as foon: as the was come, and understanding the case no better than they use to do, endeavoured all she could to bring her to Bed. augmenting her pains, by sharp Clysters, making her walk about her Chamber, as if she had been at her full time; but finding at two days end no forwardness, notwithstanding the continual pains, the fent for me to know what was fit for her to do in that case: I went to the Woman, and found the inward Orifice of the Womb dilated enough for the top of my little Finger to enter into its inward part, and yet wider towards the outward part; but confidering that fhe had no other accident but those pains, I caused her immediately to go to Bed, where the continued eight or nine days in which time her pains ceased, the Womb closed exactly, as I found some days after, and the went on with her Child three full months longer, and was then brought to bed of a Daughter at the full time, strong and robust, yet living, and now five years old or thereabouts. Now had I purfued what they began, this Woman without doubt would have miscarried at fix months, for it would have killed the Infant in her Belly, and foon after the must have miscarried. It is fit to follow this example in the like occasion, provided the pains are not accompanied with accidents, which may endanger the life of the

the Mother if not presently delivered; as frequent Convultions, confiderable floodings, of

which we shall fpeak in its place.

To be well informed of the different times of pregnancy, the Womans own relation may fometimes ferve turn, yet'tis not fit alwayes to trust it; it may help to conjecture, because many Women are themselves deceived, concluding themselves with Child, from the staying of their Courses, or from their quickning, which is not alwayes a certain rule. We usually judg by the bigness of the Belly: but more furely by touching the inward orifice of the Womb. When they are young with Child, we can only know it by the figns of conception, because what is then in the Womb is of no considerable bigness to swell a Belly; but rather on the contrary at that time it grows flatter. for the reasons before recited: but after the second month the Belly begins by degrees to wax bigger, till the ninth month. At the beginning, in touching the inward Orifice, you find it exactly close and somewhat long, resembling the muzzel of a Puppy new pup'd; and is then very thick: but by little and little, through the extenfion of the Womb, it diminisheth so in all its proportions, that when the Woman cometh near her reckoning, it is perfectly flat, and almost equal with the Globe of the Womb, so that it becomes like a small circle, a little thick at its entry, where the Garland is made at the time of Labour one are their time; but by the abourtooth

Neither may the time of Pregnancy be always judged by the great swelling of the Belly; because some are bigger when they are half gone, than C 3 others

others at their reckoning; it depending much on the highest of the Infant, and their number; and yet again, as there is more or less Water inclosed with them in the Womb; but much rather by the internal Orifice, which grows daily thinner and flatter, and so much the more by how much a Woman comes nearer her Reckoning; much in the same manner as a tender skin diminishes in thickness, according as it is extended and dilated; even so this Orifice grows thinner by the extension which the head of the Infant causeth to it, usually pressing hard against it the last months. This remark is often useful to us in the admission of big-bellied Women, that desire

of big-bellied Women, that delire

* An Heffical to lie in in the * Hoftel de Dien

fo salled, in at Paris, which I very often ob
ferved in my practice there of De
liveries in the Year 1660, through

the permission which my Lord, the first President, was pleased to give me, (for there is no place so fit to perfect one in a short time, in the practice of to necessary an Operation, because of the great number there daily delivered of all forts) the order is that any Women with Child shall be there charitably received fifteen days, or thereabouts, before their Reckoning; to which purpose they are searched before they are admitted, because many, glad of a good entertainment for nothing, present themselves there two or three months before they should, saying and affirming they are near their time; but by the above-mentioned Confiderations, one may easily judge and know within a very little, who are fit to be received, and who not, when they are near their time; others

time 4 and by this means may likewife know when this necessary to forward Labour, or retard it, as much as ought to be, when Women are not

yet gone their full time.

As to what respects the several terms to which a Woman may go with Child; there is a great controverse amongst Authors, but all agree that the most ordinary terms are either the seventh or the ninth month, which is known and also approved by all. Hippocrates is of an opinion that a Child born in the eight month cannot live, because he cannot support two such puissant endeayours to near one to another, having already endeavoured to be born the feventh month, which is (as he faith) the first legitimate term of Labour; and failing then, if, reitering the same endeayours the eighth month, he be born, he is thereby fo weakned, that he feldom lives, as he often doth, when born by the first endeavous in the seventh month, his strength not being before exhausted by vain attempts. This seems very likely to many: but if they that practife Deliveries, make a true reflection, they will find, that it is the Matrix alone, affilted with the compression of the Muscles of the lower Belly and Diaphragma, which cause the expulsion of the Child, being stirred up by its weight, and not able to be further extended to contain it; and not, as is ordinarily believed, that the Infant (being no longer able to stay there for want of the nourishment and refreshment) useth his pretended endeavours to come forth thence, and to that purpose kicking strongly, he breaks with his feet the Membranes which contain the Waters, inafmuch as when the Child

Child is naturally born, the Membranes are always rent before the head, which pressing and thrusting each Throw the Waters before it, caufeth them to burst out with force. The same Hippocrates likewise admits the tenth month, as also the beginning of the eleventh, at which time he faith the Children live: but he will by no means that Children can live if born before the feventh, forafmuch as they are then too feeble, and not capable to support the external injuries, as indeed

we fee and find it every day.

I do boldly affirm, and it is also very true, that the ordinary term of going with Child is nine whole months: but I cannot confent that Children born in the feventh month, do oftner live than those in the eighth; but much to the contrary I believe that the nearer they approach to the natural term of nine months, the itronger they are; and therefore that Children born in the eighth month rather live than those of the feventh: which is wholly contrary to the opinion of many persons, who blindly follow in this the fense of Hippocrates and all Authors, without making any reflection upon the thing, to disabuse themseves of this vulgar belief, founded on the pretended vain endeavours, which (they fay) are made by the Infant in the feventh month: for, as there are not only in the fame Countrey and Field, but also on the same Vine Grapes, sometimes six weeks ripe before their ordinary feafon, and others not till above a month after, which happens according to the Soil, the different regards of the Sun, and cultivating of the Vine: So likewise we see Women brought to Bed of their Children fix weeks and two months before, and fometimes

as long after their ordinary term; whether it is that the Womb being incapable of an extention beyond a certain degree, cannot bear its burden. but a little while after the reckoning is out, although there have been Women, as Hippocrates acknowledgeth, who have gone ten or eleven whole months with Child, which notwithstanding is so much the more rare, by how much it exceeds its limits. These things happen also to Women according to the different dispositions either of their whole Body, or of their Womb alone, or as well according to their way of living, and the greater or leffer exercise they use, and may likewife happen on the Childs part : for example, if at feven months he is so big, that the Womb can no longer contain him, nor dilate it felf more without bursting, it is then provoked by the pain which this violent extention caufeth, to discharge it felf of him; and fo likewise in the eighth month, if there be the same reason, and some weeks sooner or later, according to a multitude of other circumstances; or also by any outward cause, as violent shaking of the whole Body, blow, fall, leap, or any other what soever, hastning the pains of Delivery; that which makes these Children live a longer or a leffer while, is, according as they are at that time more strong and perfect, and the Woman nearer her time, which is the end of the ninth month.

There are many Women that believe they were brought to bed at the feventh and eighth month; as likewife others, that they went ten or eleven whole months with Child (which may fometimes be) when notwithstanding they are effectively

effectively delivered at the due time. That which deceives them, usually is, their believing (as we have already faid) themselves with Child from the time of the retention of their Courses, having had them during the two first months of their Pregnancy, yea and fometimes longer; and others also mifreckon themselves, when their Courses are stopped two months before they Conceive. It is also true that a Woman though well regulated, cannot exactly know by the suppression only, the certain time of her being with Child: for example, if the lies with her Husband upon the point of the coming down of her Terms, and conceives upon it, then may her reckoning be from the time of their suppression, which may come near the truth: but if the conceives immediately after she hath had them (which happens oftenest) and that all along the whole month the daily copulates with her Husband, at the end of which time her Courses not coming down, the may very well reckon her felf with Child; yet for all this the cannot know by this fign which night the conceived; and fo for three weeks or a month more or lefs the may be mistaken in the time.

Ae Children are more or lesslong-liv'd, according as they approach nearer the ninth month; To it may easily be known that they of six months, and much less younger, cannot be long-lived, because they are yet too weak to resist outward injuries. There hath often been great contests amongst Physitians to determine, whether a Child born the eleventh or twelfth month after its pretended Father's death can be legitimately born,

and confequently admitted to inheritance, or ra-

This question hath been as well debated sometimes by the Romans as by us, and there have been Parties both for and against this opinion: for my part I will, to avoid prolikity, leave it undiscided, and add nothing upon this point to what I have mentioned before.

bon old To CHAP, VII.

Whether it can be known that a Woman is with Child of a Boy or a Girl, and the signs.
Whether she shall have many Children.

T is no great matter to fatisfie the curiofity and disquiet of a Woman, who defires to know whether she be with Child or no; but there are many, if not most, that would have one proceed further, and tell whether it be a Boy or a Girl. which is absolutely impossible; though there is hardly a Midwife that will not boast her felf able to resolve it (in effect it is easier to guess, than to find the truth) for when it happens, it is certainly rather by chance, than by any knowledg or reason they could have to enable them to foretel it. But sometimes one is so pressed and importuned to give Judgment, chiefly by Women who never had Children, and often by their Husbends, not less curious, that one is obliged to fatishe them as much as possible in that case, by the examen of some signs very incertain.

There

There are many figns upon which this knowledge is grounded (if there can be any, which I do not believe) of which the two principal are taken out of Hippocrates; the first is in his 42th Aphorism of the fifth Book, which is, Mulier gravida, si marem gerit, bene colorate est; si vero feminam, male colorata: A Woman with Child of a Boy is well coloured; but of a Girl, ill coloured. And the other is in his 48th Aphorism of the same Book, which is, Fætus Mares dextra uteri parte, famina sinistra magis gestantur : For the most part the Male Children lye in the right fide, and the Females in the left. Moreover, they fay, a Woman with Child of a Boy, is more merry and jocund, bears it much better, is not so difgusted, finds it quicken fooner, and her right Breaft fills before the left, and is also more firm, and that all the right parts of her body are fironger and more active : as for example, if the fate, kneeled, or stood upright, she would make her first step with her right foot; but if it be a Girl, the would have all the figns contrary to the above mentioned.

Some persons pretend to know it by inspecting Urines, which is as uncertain; for we daily find Women well coloured, and have all the signs of being with Child of a Boy, and yet are brought to bed of Girls, contrary to the hopes given them: And others, though they have signs derectly opposit, bring forth Boys. Some believe they understand it better than any other, by considering the time of conception; for, say they, if the Woman conceives at the increase of the Moon, she shall have a Boy, and contrarily a Girl,

Girl, if at the decrease: but this falls out as feldom, as may eafily be known, by the observation have made at the Hoftel de Dien at Paris, and may be daily observed by others as well as my felf; which is, that having in one and the fame day delivered eleven Women there, all at their full time, five of them had Boys, and the other ix Girls. Now we may well judge that they all conceived at one time, because all were brought to bed at the same time; and ought (if this rule were true, and that they were all governed by this Planet) to have had either all Boys, or all Girls; and not some Boys, and some Girls, as here it happened, and doth every day in the same place; whereas in all other places are indifferently born both Boys and Girls.

Others again believe the Males to be begotten of the Seed which comes rather from the right Tefficle than the left, efteeming it hotter, and not to waterish, because the right Spermatick Vein comes from the trunk of the Vena cava; and that of the left fide takes its rife from the Emulgent; but if they know after what manner the blood is circulated, they would find that the Blood of the Emulgent is not more serous, than that of the Vena-cava, forasmuch as it is purged of its superfluous serosity by the Reins, before it enters this Emulgent; they would likewise know that the Seed of both Testicles is the same exactly, being made of the same blood, brought to them not by the Reins, but only by the two Arteries, which arise out of the Trunk Aorta, otherwife called the great Artery; wherefore the left is as well disposed to produce Males as Females; knitting up one of the Teltidles of their Bullsac, dording as they defire either Males or Females. I know an Italian at Rome who had only his left Telticle, the right being upon a good occasion lost, after that accident married, and begat two Children, which I faw alive, and very well, a Boy and a Cirl, besides all he may have begotten since that time: nor needed he suspect his Wife had the assistance of any other in that business, as it

very often happens in this Country.

Such as defire to foretel before the Child be born, whether it be Boy or Girl, do ufually adhere by complacency, to the defires of the bigbellied Woman and her Husband in this cafe; for if the Midwife knows they defire a Boy, she will affure them it will be a Boy, and swear to it also, And if they wish'd a Girl (as it also happens to some Women, who love Girls best) they will say it shall be a Girl, and lay wagers of it too. If this luckily succeeds according to her prognostic, she will not be backwards to affirm she knew it very well: but when it happens contrary to her prediction, she makes her felf reputed ignorant and presumptuous, and remains ashamed.

For my part I should do quite otherwise: for knowing beforehand the person's desires, I should give my advice always quite contrary; because if it happen to be true (although by chance) what was foretold, they will then conclude me to be knowing, and to have said well: if otherwise (which may be once in twice) the Woman and her Husband obtaining what they desired, will not take so much notice of it, because one always

receives

receives with a good welcome what they defire,

though unhoped for.

Having shewed that it is impossible to know whether a big-bellied Woman shall have a Boy or Girl because of the uncertainty of the signs upon which they ground their predictions; We will affert, that it is not the same; whether a Woman is conceived of more then one. Many Authors have affirmed that a Woman cannot bring forth above two Children at once, because they have but two Breaks as also, because there are but two cavities in the Womb, different from most other Animals, which have many little cells in it, and also many teats, wherefore they bring forth many young ones, nfually answering the number of little Cells of their Womb : this is very true of other Animals, but the Womb of a Woman hath but one only cavity (unless they would have the two fides taken for cavities) for there is in the Womb only a fimple long line, without any other feparation.

There are daily Women brought to bed of two Children at once, fometimes of three, and vere rarely four. Yet I knew one Mr. Hebert, Couverer of the King's Buildings, who was so good a Couverer, that his Wise about seventeen years since brought forth four living Children at a birth; which the Duke of Orleans deceased coming to hear of, to whom (because of his jovial humour) he was very welcome; the Duke asked him (in the presence of divers Persons of Quality) whether it were true, that he was so good a Fellow as to get his Wise with Child of those four at one Bout? He answered very coldly, Tes; and

that he had certainly begat at the same time balf a dozen, if his foot had not flipt; which made them Having howed than

all laugh very heartily.

But I esteem it either a Miracle, or a Fable what is related in the History of the Lady Margaret Countels of Holland, who in the year 1313 was brought to bed of 365 Children at one and the same time; which happened to her (as they fay)by a poor Woman's Imprecation, who asking an Alms, related to her the great milery the was in by reason of those Children she had with her: To which the Lady answered, She might be content with the inconvenience, since she had had the pleaeden of the overest where ele

fure of getting them.

Since the most usual number is two, that Women have, (who have more than one Child at a time) We will give the figns, which do not appear in the first months, nor sometimes till they are quick. There is some likelihood of it, when a Woman is extraordinaly big, and yet suspects no Dropsie; and more, if there be on each side of her Belly a little rising, and as it were a line a little depressed, or not so elevated about the middle; and most of all, if at the same time one feels many and different motions on both sides; and if these motions are more frequent than usually, which is, because the Infants being straitned, inconvenience each other, and cause that fashion motion: If all these figns concur, tis then very probable the Woman goes with more than one Child.

Tentre od de C H A P. VIII.

Of SUPERFÆTATION.

There is great dispute, whether a Woman (who hath two or more Children at once) conceived of them at one, or at several Coitions. We see indeed daily that Bitches, Sows, and Rabets have divers young with but one copulating, which may very well make us judge the same of a Woman. Some will have this to be by Superfactation: but there are signs by which we may know the difference, whether both Children were begotten at once; or successively one after the other.

Superfatation, according to Hippocrates, in his Book which treats of it, is a reiterated Conception, when a Woman being already with Child, conceives again the fecond time. That which makes many believe there can be no Superfatation. is, because, as soon as a Woman hath Conceived. her Womb closeth and is exactly firm, so that the Seed of a Man, abfolutely necessary to Conception, finding no place nor entry, cannot (as they fay) be received, nor contained in it, to cause this second Conception. To this may be added, that a pregnant Woman dischargeth her Seed (which is as necessary for it as a Mans) by a Vessel which terminates on the fide of the exterior part of the inward Orifice; which Seed by this means is shed into the Vagina, and not into the bottom of the Womb, as it should for this purpose. However,

it may be answered to these Objections, which are very strong, that though the Womb be usually exactly thut and close when a Woman hath conceived, and, that she then sheds her Seed by another conveyance: yet this general rule may have fome exceptions, and the Womb, fo closed, is fometimes opened to let pass some serous slimy Excrements, which by their stay offend it; or principally, when a Woman is animated with an earnest desire of Copulation, in the heat of which action the fometimes dischargeth by the pallage that terminates in the bottom of the Womb, which being dilated and opened by the impetuous endeavours of the Seed, agitated and overheated more than ordinary, and this Orifice being at the same time a little opened, if the Man's Seed be darted into it at the same moment, it is thought a Woman may then again Conceive, which is called Superfatation. This is confirmed by a History of a Servant, related by Pliny, who having the same day copulated with two several persons, brought forth two Children, the one resembled her Master, the other his Proctor. And also of another Woman, who likwise had two Children, the one like her Husband, and the other like her Gallant. But this different resemblance doth not altogether prove Superfactation, because sometimes different imaginations may cause the same effect.

This fecond Conception is effectively as rare, as we find the decision of it uncertain; nor must we imagine that alwayes when a Woman brings forth two Children or more at once, is Superfatation; because they are almost alwayes begot in the same act, by the abundance of both Seeds received

h

-

ceived into the Womb. Nor, that it may be at all times of a Woman's being with Child: for when it happens, it cannot be either the first or second day of conception; because, if the last Seed be received into the Womb, it would make a mixture and confusion with the first, which is not yet involved with the little Pellicle, that might otherwife separate it; nor is it formed perfectly till the fixth or feventh day, as Hippocrates faw in a Woman, who about that time expelled this Geniture: Belides, the Matrix again opening it felf, could not hinder the first Seed from slipping out. being not as yet wrapt up in this little Membrane, to preserve it. This makes me not believe the Hiltory of the Woman, Pliny mentions, for the reasons alledged by him, to wit, that she used copulation the same day with two several persons : for the last would certainly have caused this confusion of Seed, as I have said, and so destroyed the work begun; but I rather believe, that this Superfatation may happen from the fixth day of Conception, or thereabouts, till the 30th or 40th at the most; because then the Seeds are covered with Membranes, and that which is contained in the Womb is not yet of a considerable bigness: but after this time, it is impossible, or at least very difficult, because the Womb being extended more and more by the growth of the Child, can hardly receive new Seed, and as hardly retain it, or hinder it from being cast forth by reason of its fulness, having received it in that estate.

When a Woman brings forth one or more Children at a birth, begotten at once, which usually are called Twins, and differ from Superfata-

tion, 'tis known by their being both almost of an equal thickness and bigness, and having but one only and common After-birth, not separated the one from the other, but by their Membranes. which wrapt each apart with their Waters, and not both in the same Membrane and Waters, as fome have believed, contrary to the truth: but if there are several Children, and a Superfectation, they will be also separated by their Membranes, and not have a common burthen, but each his part; neither will they be of an equal bigness: for that which is the Superfactation, will always be leffer and weaker, than that engendred at first; who, because of its force and vigor, draws the greatest and best part of the nourishment. Just as we find fair and great Fruit, have often near them very little ones; because those that are first knotted and fastned to the Tree, take away all the nourishment from their neighbours, who did but blossom when the first had already acquired some bigness. Sometimes Twins are not of an equal bigness, which happens according as the one or the other hath more strength to draw to it in greater abundance the best part of the common nourishment.

Six years fince I layed a Woman at her full time, whom I delivered of a very great living Girl by the feet, which first came to the birth; and fetching the After-birth, I brought with it another Child, a dead Boy, as little again as the first Girl; and seemed not to be, respecting his bigness, above five or fix months; althouthey were both begotten at one and the same act of Copulation, as was manifest by their both having but one and

and the fame Burthen, which is the true fign of it, as I have already faid; and this fecond Child was fo little that it came together with the Burthen, and wrapt up in the Membrans, which I prefently opened to fee whether it was alive; but it had been a long time dead, as appeared by its corruption.

I am not willing to fay that there never is any

Superfacation, but I fay, that it happens very rarely ; * for of *My Author is out an hundred Women that have in his computation. Twins, ninety of them have for there are near but one Burthen common to as many with two both; which is a very certain Burthens as with fign they had no Superferation, one. and much more certain than

the Indications taken from the greatness or frength of the Child, which is but conjectural.

Of a Mole, and its Signs.

OF all the feveral forts of Great-Bellies in I Women, there remains that yet to be examined caused by a Mole, of which we must always endeavour the expulsion as foon as we come to know it, being altogether contrary to Nature. The Mole is nothing but a fleshy substance, without Bones, Joynts, or distinction of Members; without form, or figure, regulated and determined; engendred against Nature in the Womb, after Copulation, out of the corrupted Seed of both Man and Woman. Notwithstanding, there are fometimes. D 3

fometimes that have fome rudiments of a rough form, blind by and this form, blink best is av

It is very certain. Women never engendred Moles without copulation, both Seeds being required to it, as well as for a true Generation. There are fome, truly, who never having had to do with a Man, do naturally cast forth, after a flooding, fome strange Bodies, which in appearance feem to be flesh; but if special notice be taken, they will find it but clods of Blood coagulated, without confiftence or fleshly texture or membranous,

as are the Moles and false-Conceptions.

Moles are ordinarily engendred, when either the Man or Womans Seed, or both together, are weak or corrupted, the Womb not labouring for a true Conception, but by the help of the Spirits with which the Seed ought to be replenished: but fo much the easier, as the small quantity found in it is extinguished, and as it were choaked, or drowned by abundance of the gross and corrupted menstrous blood, which sometimes flows thither foon after Conception, and gives not leifure to Nature to perfect, what she hath with great pains begun, and so troubling its work, bringing thither confusion and disorder, there is made of the Seeds and blood a meer Chaos, call'd a Mole, not usually ingendred but in the Womb of a Woman, and never or very rarely found in that of other Animals, because they have no menstruous Blood as she hath.

A Mole hath no burthen, nor navel-string fastned to it as a Child always hath; for a finish as the Mole it felf adheres to the Womb, by which means it receives nourifliment from its Veffels: it is likewife cloathed usually with a kind of membrane, in

which

which is found a piece of flesh confusedly interlaced with many Velfels; it is of a bigness and confiftence more or less according to the abundance of blood it receives, its disposition, and also the temperature of the Womb, and time it stays there; for the longer it stays, the harder it grows, and becomes schirrous, and difficult to be expell'd. For the most part there is but one, yet sometimes more; of which, some cleave very strongly others very flightly to the Womb. When Women mifcarry of them before the fecond month, they are called false-Conceptions: when they keep them longer, and this strange body begins to grow bigger, they are called Moles. False-Conceptions are more membranous, and sometimes full of corrupted Seed; but Moles are altogether fleshy. One may find in a Woman that hath a Mole, almost all the figns of Conception, and of a Woman with Child; but there are likewise some other which differ. because her Belly is harder and forer, than when she is with Child. The Male being contrary to Nature, is very troublefome to a Woman : and as it hath no true life, nor animal motion; fo it is very painful to go with : for the Mole falls on whatfoever fide the turns, when the is a little big, just like a heavy Bowl: She hath a great weariness in her legs and thighs, and suppression of Urine from time to time, and finds a great heaviness in the bottom of her Belly, forasmuch as this mass of flesh by its weight weighs down the Womb, which compresseth the Bladder of Urine; her Breasts are not so swell'd, neither have they any or very little Milk. It may be yet easier known, if with all these signs she finds no motion after the fourth novot?

fourth or fifth month of her Great-Belly; and certainly, if after her reckoning is out, all the aforesaid signs remain and continue in the same

manner.

These Moles are nourished in the Womb, to which they almost always adhere, and are sustained by the Blood with which it is always furnished, just as Plants are by the moisture of the Earth. Sometimes there is a Child together with a Mole, from which it is fometimes divided, and fometimes cleaving to its body; which puts it in great danger of its being milhapen or monstrous, because of the compression which this strange body caufeth to the Infant, yet very tender. In the year 1665, being at Mr. Bourdelots, Doctor in Phyfick of the Faculty of Paris, where was every Monday held Accademical Conferences: As they fell upon the discourse of the Circulation of the Blood. which I explained according to my opinion; they brought an Infant of a Woman newly brought to bed at her full time, which wanted all the unper part of the Head, having no Skull, no Brain, no nor an hairy Scalp; but had only, in lieu of all those parts, a Mole, or fleshy mass flat and red, of the thickness and bigness of an after-burthen covered with a simple Membrane strong enough: This Infant had however all the other parts of the body fat, and well composed and shap'd. This monstrous disposition was the cause of its death affoon as born, and yet was very wonderful and aftonishing to consider, how it could live fo without Brain; as also very difficult to understand, how this fleshy mass could serve instead of it. whilst it was in the Mother's Belly. It was interwoven

woven with many Vessels, like a kind of *Placenta, yet of a more *The fleshy part firm substance. Mr. Clerk and Mr. of the Burthen. Judet, my Brethren and good

Friends, were then present, and faw this Prodigy

as well as my felf.

A Woman having a Mola, hath a much worse colour, and is every way more inconvenienced than a Woman with Child; and if she keeps it long, she lives all the while in danger of her life. Some have them two or three years, and sometimes all the rest of their lives: As happed to a Peuterer's Wise, of whom Amb. Paré makes mention in his Book of Generation, who had one seventeen years, and at last died of it. We will declare the Remedies convenient for it in another place, where we speak of its extraction.

CHAP. X

After what manner a Woman ought to govern her self during her being with Child, when not accompanied with other considerable accidents, and how to prevent them.

A Woman with Child in respect of her prefent disposition, altho in good health, yet ought to be reputed as the she were sick, during that neuter estate (for to be with Child, is also vulgarly called a sickness of nine months) because she is then in daily expectation of many inconveniences, which pregnancy usually causes to those that are not well governed.

She should in this case resemble a good Pilot, who

who being imbarqued on a rough Sea, and full of Rocks, shuns the danger, if he steers with produce; if not, its by chance, if he escapes Shipwrack: So a Woman with Child is often in danger of her life, if she doth not her best endeavour to shun and prevent many accidents to which she is then subject: all which time care must be taken of two, to wit, her felf, and the Child she goes with: for from one single fault results double mischief, inassinch as the Mother cannot be any ways inconvenienced, but the Child partakes with her.

Now to the end she may maintain her felf in good health, as much as can be in that condition, which always keeps a middle state, let her observe a good dyet, sutable to her temperament, custom, condition and quality, which the right use of all

the fix non-naturals doth effect.

The Air, where she ordinarily dwells, ought to be well temper'd in all its qualities: if not fo naturally, it must be corrected as much as may be by different means. She must avoid that which is too hot, because it often causeth, by dislipating too much the humours and spirits, many weaknesses to Women with Child; and particularly also that which is too cold and foggy; for, causing great Rhumes, and distillations upon the Lungs, it exciteth a Cough, which by its fudden and impetuous motions, forcing downwards, may make her mifcarry. She ought not to dwell in very dirty narrow Lanes, nor near common Dunghils. For fome Women are so nice, that the stink of a Candle not well extinguish'd, is enough to bring them before their time, as Lieban affures us he himself had feen : which likewise may be caused, if not sooner,

by the finell of Charcoal, as happened once to a Laundress I knew, that miscarried the fourth month; being in extream haste to finish some Linen on a Saturday hight, she had not patience to kindle the Charcoal in the Chimney, but in the Rome in a Chasindish, which slew up into her head, and made her miscarry the same night, and in danger of dying. Let a Woman therefore endeavour, as much as her convenience will permit, to live in an Air free from these inconveniencies.

The greatest part of Women with Child have fo great loathings, and fo many different longings, and strong passions for strange things, that it is very difficult to prescribe an exact dyet for them: but I shall advise them in this case to follow the opinion of Hippocrates, in Book 2. Aphor. 38. where he faith, Paulo deterior & potus & cibus, fuavior tamen, melioribus quidem, sed in suavioribus, preferendus. Meat and drink tho not so who some if more acceptable, is to be preferred before that which is wholesome, and not so pleasant : which in my opinion is the rule they ought to observe, provided what they long for, is commonly used for dyet, and not strange and extraordinary things; and that they have a care of excess. If the Woman be not troubled with thefe loathings let her then use such dyet, as breeds good juyce, and in quantity sufficient for her and the Child, which her appetite may regulate. She must not then fast, nor be abstemious, because overheating her blood thereby, renders it unfit to nourish the Child. which ought to be fweet and mild, and makes it tender and weak, or constrains it to come before its time, to fearch what is fit for it elsewhere:

the must not eat too much at a time, and chiefly at night, because the Womb by its extent possessing a great part of the Belly, hinders the stomach from containing much, and causeth thereby a difficulty of breathing because it compresset the Diaphragma, which as then hath not an intire liberty to be Wherefore let her rather eat a little and often; let her Bread be pure Wheat, well baked and white, as is that at Goneffe at Paris, or the like; and not course houshold Bread or Bisket, which swells up the stomach, nor any other of the like nature that's very stuffing. Let her eat good nourithing meat, as are the tenderest parts of Beef and Mutton, Veal, Fowl; as fat Pullets, Capons, Pigeons and Partridge, either roaft or boyled as the likes beft; new layed Eggs are alfo good: and because big-bellied Women have never good blood, let her put into her Broths those Herbs which purifie it, as Sorrel, Lettice, Succory and Borrage; the must avoid hot-feafoned Pies and baked Meats, and especially Crust, being hard of digestion, extreamly overchargeth the Stomach: If the hath a mind to Fish, let it be new, and not falted, Fish of Rivers and running streams; foralmuch as Pond-Fish tasts of mud, and breeds ill juyce. But when Women cannot absolutely refrain their extravagant longings, it is better (as we have already faid) to fuffer them to deviate a little from this rule of dyet (provided it be moderate) than too much to oppose their appetites. They may drink at their meals a little good old Wine well temper'd with Water, rather Claret than White; which will help make a good digestion, and comfort the stomach, always weak during pregnancy;

pregnancy; and if they were not used to drink it before, let them accustom themselves to it by degrees; and as well in drinking as eat-

ing, they must shun all things hot * Medicines and * diurectick, because they pro- which cause voke the Courses, which is very pissing.

prejudicial to the Child.

By moderate sleep, all the natural functions of a Woman are fortified, and particularly the concoction of food in the stomach, then very subject to loathings and vomitings. We say, moderate; because, as excessive watchings dissipate the Spirits, so too much sleep choak them. Let therefore Women with Child sleep nine or ten hours at least in four and twenty, and twelve at most; and rather in the night-time, as sittest for rest, than the day, as persons of quality are accustomed, who frequenting the Court, ordinarily turn night into day. However they who have gotten this ill habit, had better continue it than change too suddenly, because this custom is become natural to them.

For what respects exercise and rest, let them govern themselves according to the different time of their being with Child; for at the beginning of the Conception (if the Woman perceive it) she ought (if she can) to keep her Bed, at least till the sisth or sixth day, and by no means to use copulation all the time; for simuch as the Seeds being not yet covered with the membrane, formed in that time (as we have said already) are in the beginning, by the agitation of the body, very apt in some persons to slip forth. She ought neither to go in Coach, Chariot or Waggon, nor on Horseback, whilst with Child; and much less the nearer she

comes to her time : because this kind of exercise doubles the weight of what is contained in the Womb by the jolts the receives, and often makes her miscarry : But she may walk gently, go in a Sedan or Litter; She ought neither to carry or lift heavy burdens, nor lift up her arms too high : and therefore she ought not to dress her own head, as the used to do because it cannot be done without stretching her arms too much above her head. which hath caused many to miscarry before their time; because the ligaments of the Womb are at an instant loofened by these violent extentions. Let her exercise, be gentle walking, and the heels of her shoes low; because Women cannot, for the bigness of their bellies, see their feet, and so are Subject to stumble and fall: In short, she must govern her felf in these exercises, rather to err in too much rest, than in too much exercise; for the danger is greater by immoderate motion, than in too much rest. It is impossible for me in this point to be of the opinion of all other Authors, tho the whole World follows them in this their evil and dangerous counsel, who would have a pregnant Woman exercise her self more than ordinary toward the latter end of her reckoning, that fo, as they fay, the Child may fink lower: But if they consider the point well, they would without doubt find it to be the canse of more than half of the hard Labours; and that on the contrary, rest would be more advantagious to them, as I shall prove by the following explication.

First, We must know and take for granted that the birth of a Child ought to be left to the work of Nature well regulated, and not provoke it, by shaking T.J.

king with exercise to dislodge it before its full time : which hapning (tho it be but feven or eight days fooner) proves fometimes as prejudicial to the Infant, as we fee it is fometimes to Grapes, which we find four or five dayes before they are full ripe, to be yet almost half Verjuice. But to explain more clearly than by this comparison, that these kind of exercises often cause hard Labors (as we have already faid); confider that the Infant is naturally scituated in the Womb with the head uppermost, and the feet downwards, with its face towards the Mothers Belly, just till it hath attained to the eighth month; at which time, and fometimes fooner, and fometimes also later, his head being very great and heavy, he turns over, his head downward and his heels upwards, which is the fole and true scituation in which he ought to come into the World, all other postures being contrary to Nature. Now just when the Child is about to turn according to custom into his intended posture, instead of giving her self rest, she falls a jumping, walking, running up and down stairs, and exercifing her felf more than ordinary, which very often causes it to turn cross, and not right as it ought to be; and fometimes the Womb is depressed fo low, and engaged in fuch fort towards the last month, in the cavity of the. Hypogaster, by these joltings, that there is no liberty left the Infant to turn it felf naturally; wherefore it is constrained to come in its first posture, to wit, by the feet, or fome other worfe. Moreover, it would be very convenient that the Woman to this end should abstain from Coition, during the two last months of her reckoning, forafmuch as the Body is thereby much

1

fe

W.

much moved, and the Belly compressed in the action, which likewife canfeth the Child to take a wrong posture. I believe that they that will ferioully reflect on these things, will make no difficulty to quit this old error, which hath certainly caused the death of many Women and Children, and much pain to divers others, for the reafons above-mentioned.

Some have miscarried only with the noise of a Cannon; as also with the found of a great Bell; but especially a clap of Thunder, when of a sud-

den it surpriseth, and frights them.

Big-bellied Women are fometimes fubject to be costive, because the Womb by its weight pressing the Rectum hinders the Belly from discharging its Excrements with eafe. They that are troubled with this inconveniency, may use Damask-Prunes flewed, Veal-Broth, and Herb-Pottage, with which they may gently moisten and loosen the Belly. If

Lenitive.

these things are not sufficient, * Clysters better they may give her gentle *Clyforborn without Iters of Mallows, Marsh-mallows, urgent necessity, Pellitory and Aniseeds, with two and add Senna ounces of brown Sugar distolved to the Prunes, or in it, adding a little Oyl of Viogive some other lets; or else a Decoction made with a handfull of Bran, two ounces of Honey of Viotets, and

a Piece of fresh Butter; or any other as occasion might require : but there must be great care taken that no sharp Clyster be given her to this purpose, nor other Drugs to cause a looseness, or too great an evacuation, left it endanger her to miscarry: as Hippocrates very well warns us in the

the 134th Aphorism of his fifth Book, where he favs. Mulieri in utero gerenti fi alvus plurimum profinat, periculum eft ne abortiat. If a big-bellied Women have a violent loofness, the will be in danger of miscarrying, od romen significanto of bail

If the ought to govern her felf well in the obfervation of what we have lately mentioned, the ought no less to be careful to overcome and moderate her Passions, as not to be excessive angry; and above all, that she be not afrighted; nor that any melancholy news be fuddenly told her: for these Passions, when violent, are capable to make a Woman miscarry at the moment, even at any time of her going with Child; as it hapned to my Confin's Mother, Mrs. Dionis, a Merchant, dwelling in the Street Quinquampois, whose Father being suddenly kill'd with a Sword by one of his Servants, who meeting him in the Street, traiteroully run him thorow out of spite and rage, because he had some few days before turn'd him out of doors: they brought immediatly this ill news to his Wife, then eight months gone, and presently after brought her dead Husband; at which fudden fright she was immediately surprised with a great trembling, so that she was presently delivered of the faid Dionis, who is to this day (which is very remarkable) troubled with a shaking in both hands, as his Mother had when she was delivered of him, having yet no other inconvenience, notwithstanding he was born in the eighth month, by fuch an extraordinary accident; nor doth he feem to be above forty years old, tho near fifty. When he figned his Contract of Marriage, they who knew not the reason of it, when they saw his hands

hands hake, thought it was through fear of his ill bargain of which they were disabused when they had heard the Cataftrophe that hastened his birth. Wherefore if there be any news to tell a big-belfied Woman, let it rather be fuch as may moderately rejoyes her, (for excellive joy may likewife prejudice her in this condition); and if there be absolute necessity to acquaint her with bad news. let the gentlest means be contrived to do it by

degrees, and not all at oncel all reds. He orock be

Alfoon as a Woman finds her felf with Child. or mistrusts its electer not lace her felf so close, as the ordinarily doth, with Bodies stifned with Whalebone to make her Body shapely, which very often injures her Breafts, and fo inclofing her Belly in fo frait a mould, the hinders the Infant from taking its free growth, and very often makes it come before its time, and mishapen. Those Women are fo foolish as not to mind, that making themselves slender when they are with Child quite spoils their Belly, which therefore after Childbed remains wrinkled and pendent as a Bag, and then they cry It is the Midwife or Nurse that did them that mischief, in not swathing and looking to them as they ought to do; not confidering that it came by their strait lacing whilft they were big upwards, which causes the Belly, finding no place to be equally extended on all fides, to dilate it felf only downwards, whither all the burthen is in that manner thrust : to avoid which, let them use habits more large and easie; and wear no Busks, with which they press their Bellies to bring them into shape. Let them also forbear Bathing in any manner, after they know they have conceived.

Talk 3

ceived, lest the Womb be excited to open before the time. Almost all big-bellied Women are so infatuated with the cultom to bleed when they are half gone, and in the feventh Month, that if they should neglect it, (although they were otherwise well) they would never believe they could be fafe delivered. I will not in the mean time justify and make them believe by that, what Hippocrates faith in his 31ft Aphorism of his 5th Book, Malier in utero ferens, secta vena abortit, coque magis fi fit fotus grandior. If (faith he) a Woman be blooded, the miscarries; and the rather, if the be far gone. This Aphorism must not prohibit us the use of bleeding when the case requires but only warns us to use it with great Prudence; forasmuch as some Women want bleeding three or four times, yea, and oftner, whilst they are with Child, when twice may be fufficient to others: For as there have been some that have been blooded nine or ten times for Diseases during their Pregnancy, and yet go on with their Infant to their full Account; fo others have miscarried by bleeding but once a little too copiously, as in this Aphorism speaks Hippocrates. Now fince all are not of the same Nature, they must not all be governed after the same Manner, nor believe that it is necessary to bleed all big-bellied Women; one may judge of the necesfity according as they are more or less sanguine.It is the fame in purging, which ought to be prudently administred as well as bleeding, according to the Exigency of the Case, using always gentle and benign Remedies when they are necessary; as Cassia, Rhubarb, Manna, with the weight of a dram or two at most of good Senna. These Purgatives may serve E 2 turn turn for a Woman with Child, the ought not to use others more violent: If the observes all that we have afore-mentioned, the may then hope for

a good Islie of her great-Belly.

Having amply enough declared how a Woman with Child should be governed when accompanied with no ill Accident and given the Rules she ought to keep to prevent them, We will now examine feveral Indispositions, to which she is subject particularly during her Pregnancy.

CHAP. XI.

The means to prevent the many Accidents, which happen to a Woman during the whole time of her being with Child; and first of Vomitings.

Omiting, with the suppression of the Terms, is for the most part the first Accident which happens to Women, and the means by which they themselves perceive their Pregnancy. It is not always caused, as believed, from ill Humours collected in the Stomach, because of this stoppage of their Courfes: which corrupted Humours do often cause a depraved Appetite in pregnant Women, when either they flow thither, or are there engendred; but not this Vomiting which happens immediately after Conception: not but that in process of time it may be continued by those which are there afterwards corrupted; but these first Vomitings proceed from the Sympathy between the Stomach and the Womb, because of the similitude of their Substance, and by means of the Nerves inferted'

ferted in the upper Orifice of the Stomach, which have communication by continuity with those that pass to the Womb, being portions of the fixth pair of those of the Brain. Now the Womb, which hath a very exquisite Sense, because of its membranous composition, beginning to wax bigger, feels some pain, which being at the same time communicated by this continuity of Nerves to the upper Orifice of the Stomach, causes there these nauseatings and vomitings which ordinarily happen. And to prove that it is thus in the beginning, and not by pretended ill Humours, appears, in that many Women vomit from the first day of their being with Child, who were in perfect Health before

they conceived, * at which time the suppression of the Terms could not cause this Accident: which proceedeth from this Sympathy in the very same manner; as we see those that are wounded in the Head and Bowels, and

* And yet may have ill Humours in the Stomach, which by the frength of the retensive Faculty, may be test quiet, till by Wound or Conception they come to be moved.

that have the Stone-Cholick, are troubled with Loathings and Vomitings, and yet have no corrupt Humors in the Stomach. Loathings and Vomitings, which are motions of the Stomach contrary to Nature, happen to big-bellied Women from the beginning, for the reasons above-recited.

Loathing or Nauseousness, is nothing but a vain desire to vomit, and a motion by which the Stomach is raised towards the upper Orifice, without casting up any thing. And Vomiting is another more violent endeavour, by which it casts forth of the Mouth what Humor soever is contained in its

Capacity. In the beginning Vomiting is but a fingle Symptom not to be feared; but continuing a long time, it weakens the Stomach very much, and hindring Digeftion, corrupts the Food instead of concocting it, whence afterwards are engendred those ill Humors which need Purging. These Vomitings ordinarily continue to the third or fourth Month of being with Child, which is the time the Child appears manifestly to quicken in after which it begins to cease, and Women to recover the Appetite they had lost during their being young with Child; because the Infant growing stronger and bigger, having need of more Nourishment, consumes abundance of Humors, which hinders the flowing of fo much superfluity to the Stomach; besides, at that time the Womb is by degrees accustomed to extention: It continues in some till they are delivered, which often puts them in danger of miscarrying, and the rather, the nearer the Woman is to her full time. Others again are more fometimes tormented with it towards the end of their Reckoning than at the beginning: because the Stomach cannot then be fufficiently widened to contain eafily the Food, being compressed by the large extention and bigness of the Womb. Such a Vomiting which comes about the latter end of the Reckoning to Women whose Children lie high, seldom ceaseth before they are brought to Bed.

You need not wonder, or be much troubled at the Vomitings in the beginning, provided they are gentle and without great straining, because they are on the contrary very beneficial to Women; but if they continue longer than the third or fourth Month, they ought to be remedied, because the

Ali-

Aliment being daily vomited up, the Mother and the Child, having need of much Blood for their Nourishment, will thereby grow extreanly weak, besides the continual subversion of the Stomach, causing great lagitation and compression of the Mothers Belly, will force the Child before its time,

as is already mentioned.

To hinder this Vomiting from afflicting the Woman much or long (it being very difficult to hinder it quite) let her use good Food, such as is specified before in the Rules of Diet; but little at a time, that the Stomach may contain it without pain, and not be conftrained to vomit it up, as it must when they take too much, because the big-Belly hinders the free extension of it : and for to comfort and strengthen it (being always weak) let her feafon her Meat with the Juice of Orenges, Lemons, Pomegranets, or a little Vermice or Rofe-Vinegar, according to her Appetite. She may take likewife a Decoction made of French-Barley-Flower, or good Wheat-Flower, having dried the Flower a little before in an Oven mixing the Yolk of an Egg with it; which is very neurithing and of easy digestion: she may likewise eat after her Meals a little Marmalade of Quinces, or the Jelly of Goosberries; let her Drink be good old Wine, rather Claret than White, being well mixed with good running Fountain-Water, and not that which hath been kept long in Cifterns, as is most of the Water of our Fountains of Paris, which acquire by that stay an evil Quality: If she cannot get such fresh Waters, let her rather use River-Water taken up in a place free from Filth, in which the may fometimes quench hot Iron: Above all let her for-

E 4

bear all fat Meats and Sauces, for they extreamly moisten and soften the Membranes of the Stomach, which are already weak enough, and relaxed by the Vomitings, as also all sweet and sugared Sauces, which are not convenient for her, but rather such as are a little sharp, with which it is delighted

and comforted.

But if notwithstanding these Precautions, and this regular Diet, the Vomiting (as it fometimes happens) continues still, altho the Woman be a-. bove half gone, it is a clear fign there are corrupt Humors cleaving to the in-fides of the Stomach, which being impossible to be evacuated by fo many preceding Vomitings, because they adhere so fast, must be purged away by Stool to effect which they need a Diffolvent, which may be a gentle Purge, made by infusing half a dram of Rhubarb, a dram or two at most of good Senna, and an ounce of Syrop of Succory, which Purge disfolves the Humors, and in evacuating them, comforts the parts: Or,it may be made with young Mallows, Cassia, Tamarinds, or any other gentle Purgers, according as the case requires, always adding a little Rhubarb, or compound Syrup of Succory; observing likewise what Humors ought to be purged : For, as Hippocrates faith, in the 12th Aphorism of his first Section, In perturbationibu ventris, & vamitibus fonte evenientibus, si quidem qualia oportet purgari, purgentur, confert & facile ferunt : sin minus contra, &c. In perturbations and dejections of the Belly, and in spontaneous Vomitings, if the matter be purg'd away, which ought to be, the Patient finds eafe and comfort : if not, the contrary. Therefore we are roconfider, that it is not enough to purge, unless bear

we evacuate the peccant Humors; for otherwise purging more weakens the Stomach, which it would not if it were well ordered, and convenient to evacuate the vicious Humor. If once be not fufficient, it may be repeated, giving the Woman fome few days respit between both: if the Vomiting continues daily, almost without intermission. althothe Woman observes a good Diet, and after the hath been reasonably well purged, we must rest there, left fomething worse happen, for which we may incur blame; the being then in great danger of miscarrying: and when the Hiccough takes them through emptiness, proceeding from too much Evacuation, caused by these continual Vomitings, it is very bad, as the third Aphorism of the fecond Book teacheth us, A Vomitu fingultus malum.

Some advise, after all these things have been tryed in vain, great Cupping-glasses should be applied to the region of the Stomach, to keep it firm

in its place: but I believe it to be a Chip in * Pottage, which doth neither good nor hurt; because the Stomach is

* I hold them very beneficial, if applied with Judgment.

loose, and no ways adhering to this upper part of the Belly. But since these Vomitings cool it, and daily weaken it, I should advise a big-bellied Woman to wear in the Winter, upon its region, a good piece of warm Serge, or soft Lambskin, which would a little warm those parts, and help Digestion, which is always weak. The Italians have a Custom, which is not bad; they wear to the same purpose a fair piece of Stuff under their Doublets upon the region of their Stomach, of which they are so careful, that if they should leave it off but two

gr

to

Days in the Winter, nay even in the Summer, they would think themselves sick; and they are so great lovers, and so curious of it, that this Stomacher is often their greatest bravery, enriching it with Gold and Silver Embroidery, and Ribonds of very fine Colours.

We have discoursed enough about Vomiting, caused by Pregnancy: wherefore we will pass for-

wards to some other Accidents.

CHAP. XII.

Of Pains of the Back, Reins, and Hips.

A LL these Accidents are but the effects of the dilatation of the Womb, and the compression it makes by its greatness and weight on the neighbouring parts; which are much greater the first time the Woman is with Child than afterwards, when the Womb only receives the same dimensions it had already before: but when it hath not yet been dilated, it is more sensible of this extention, and the Ligaments, which hold it in its natural scituation, suffer a greater stress in the first Pregnancy, having never before been forced to lengthen to answer the extent of the Womb, than in the following Great-Bellies, to which it obeys more easily the second time.

These Ligaments, as well round as large, cause these Pains, being much straitned and drawn by the bigness and weight of the Womb, which contains a Child, to wit, the large ones, those of the Back and Loyns, which answer to the Reins, because these two Ligaments are strongly fastned to-

wards

wards these parts; the round ones cause those of the Groins, Share, and Thighs, where they terminate. They are fometimes fo violently extended by the extream bigness and great weight of the Womb, especially of the first Child (as I faid before) that they are lacerated and torn, being not able to yield or stretch any farther, and chiefly if the Woman in that condition makes a falle Step, which caufeth in them almost insupportable Pains, and other worse Accidents; as it happened two Years fince to a near Kinfwoman of mine, who being fix Months gone, or thereabouts, of her first Child, felt the like after the had stumbled, and perceived at the fame moment fomething crack in her Belly towards the region of the Reins and Loyns, which was one of these large Ligaments, with a kind of noise, by the sudden Jolt she received. At the same instant she felt extream Pains in her Reins and Loyns, and all the one fide of her Belly, which made her immediately vomit very often with much violence, and the next day she was taken with a great continued Feaver, which lasted seven or eight Days, without being able to fleep or rest one hour, all which time she continued to vomit all she took, with a strong and frequent Hiccough, having also great Pains, which feemed as if they would haften her Labour, which (for her fake) I was very apprehensive of, as also of her Death: but with the help of God, having put her immediately to Bed, where she continued twelve whole Days, in which time I bled her thrice in her Arm on feveral Days, and made her take at two feveral times a small grain of Laudanum in the Yolk of an Egg, a little to ease her violent Pains by giving her rest, always ordering

Cordials; all these Symptoms, which at first seemed desperate, ceased by little and little, and she went on her full time, when she was happily delivered of a Son, which lived 15 Months notwithstanding all those mischievous Accidents she met with, which were enough to have kill'd half a dozen others: but God sometimes is pleased to work Miracles by Nature, aided with Remedies fit for the purpose,

as well as by his Grace.

This Hiftory informs us (I think) very well how these Pains of the Loins, Back, and Reins come; and the pregnant Womb causeth also those of the Hips by its greatness and weight, in compressing them, and bearing too much upon them. There is nothing will ease all these forts of Pains better, than to rest in Bed, and bleed in the Arm, if there were any great Extension or Rupture of any Ligament of the Womb, as was in the case recited: And when the Womb bears and weighs too much upon the Hips, if the Woman cannot keep her Bed, she ought to support or comfort her Belly with a broadSwaith well fitted for the purpose, and to bear it as patiently as she can to the time of her Labour, which will free her from all these Accidents.

CHAP. XIII,

Of the Pains of the Breasts.

As foon as a Woman conceives, her Terms wanting the ordinary Evacuation, the Passages being stopt, and the Woman breeding daily Blood, there is a necessity, she consuming but little whilst

whilst young with Child, the Fruit being yet very little also, that the Vessels which are too full, should disgorge part, as it doth upon the parts disposed to receive it, such as are the Kernels and glandulous parts, especially the Breasts, which imbibe & receive a great quantity of it, which filling and extreamly swelling them, causeth this Pain in them, which Women feel when they are with Child, and happens also to those whose Terms are only suppressed.

In the beginning we ought to leave the whole work to Nature, and the Woman must only have. care she receives no blows upon those parts, which are then very tender, nor be streight laced with her Bodies, or other stiff Wastcoats, that night bruise and wound her; upon which follow inflammations and Abscess: But after the third or fourth Month of going with Child, the Blood being fill fent to the Breasts in great abundance, 'tis much better to evacuate it by bleeding in the Arm, than to turn or drive it back on fome other part of the Body by repercussive or astringent Mediines; because it cannot flow to any part, where can do less hurt, than in these. Wherefore I hould rather prefer the Woman being very plehorick, Evacuation, by bleeding in the Arm, than my other way, because of shunning thereby the Accident, of which speaks Hippocrates in his 40th Aphorism of the 5th Book, Quibus Mulieribus in Mammas sanguis colligitur, furorem significat: If the Blood be carried in too great abundance to the Breafts, it fignifies that the Woman is in danger of being frantick, because of the transport which may e made thence to the Brain; which Accident is woided by moderate bleeding in the Arm, as also

by a regular cooling Diet, moderately nourithing, for to diminish the quantity, and temper the heat of the Humors of the whole Habit.

factions are the Mernels and with CHAP. XIV.

Of Incontinence, and difficulty of Urine.

THe feituation of the Bladder placed just upon the Womb, is sufficient to instruct us wherefore pregnant Women are sometimes troubled with difficulty of Urine, and the reason why they cannot often hinder, nor scarce retain their Water: which is caused two ways; 1. Because the Womb with Child by its bigness and weight compresent the Bladder, so that it is hindred from having its ordinary Extension; and so incapable of containing a reasonable quantity of Urine; which is the canfe that the bigger the Woman grows, and the nearer her time the approaches, the oftner the is compelled to make Water, which for that reason they cannot keep. 2. If the weighty burden of the Womb doth very much compress the bottom of the Bladder, it forceth the Woman to make water every moment: but contrarily, if the Neck of it be pressed it is filled so extreamly with Urine, which flays there with great Pain, being not able to expel it, for a finuch as the Sphineter, because of this compression, cannot be opened to let it out Sometimes also the Urine by its acrimony excites the Bladder very often by pricking it to discharge it felf; and sometimes by its heat it makes an Inflammation in the neck of the Bladder, which caufeth its suppression. It may be likewise that this

Acci-

b

a

0

Accident is canfed by a Stone contained in the Bladder; then the Pains of it are almost insupportable, and much more dangerous to a Woman with Child, than to one that is not, because the Womb by its swelling canfeth perpetually the Stone to press against the Bladder: and so much the violenter are these Pains, as the Stone is greater

ter, or the figure of it unequal and sharp.

It is of great confequence to hinder these violent and frequent endeavours of a big-bellied Woman to make water, and to remedy it, if possible, both in one and the other Indisuositions; because by long continuance of always forcing downwards to make water the Womb is loofened and bears very much down and sometimes is forced (the inconvenience not ceasing) to discharge it self of its burden before the ordinary time. This is that should be endeavoured to be hindred, having respect to the different causes of the Distemper; as when it comes from the bigness and weight of the Womb, presfing the Bladder, as it is for the most part: the Woman may remedy it, and ease her self, if when the would make water, the lift up with both her hands the bottom of her Belly: The may wear a large Swaith accommodated to this use, which will bear it up if there be occasion, and hinder it from bearing too much upon the Bladder; or, to do better, she may keep her Bed.

If it be the acrimony of the Urine, that makes the Inflamation on the neck of the Bladder, it may be appeared by a regular cooling Diet, drinking only *Ptisan*, and forbearing the use of Wine, and all forts of Purgations, because they send the filth of the whole Body to the part affected, and by

their

their heat, do yet more augment the acrimony and Inflammation: but the will do well to use, Mornings and Evenings, Emulsions made with the cold Seeds. or Whey mixt with Syrup of Violets. This Remedy is proper, by refreshing gently, to cleanse the Urinary Passages, without prejudicing either the Mother or Infant. If the Inflammation and Acrimony of the Urine be not removed by this Rule of Diet, they may let her blood a little in the Arm, to prevent any ill Accident that may happen; they may likewise bath her outward entry of the neck of her Bladder with a Decoction of emollient and cooling Herbs, as the Leaves of Mallows, Marsh-Mallows, Pellitory, and Violets, with a little Linfeed, which being vifcous, will help the Conduit of the Urine to dilate it felf the easier; there may be also Injections given into the Bladder of the fame Decoction, to which may be added Honey of Violets, or elfe of lukewarm Milk.

But if the Woman, notwith standing she observes these Directions, cannot make water, recourse must be had to the last Remedy, which is, to draw it forth by a Catheter, represented and marked with the Letter M in the Table of Instruments, at the end of the second Book, which being anointed with Oyl Olive, or sweet Almonds, having first listed up and thrust the Belly a little upwards, must be gently introduced by the Urinary Passages into the very hollow of the Bladder, and then the Urine will immediately pass away; which being finished, the Catheter must be taken forth, and if the suppression continues, it may be used again in the same manner until the Accident quite leave her, and then they may try whether she can urine naturally. If

fhe

1

the be in very great extremity, she may use an * half-Bath * Not safe.

luke-warm, provided she be

not too much moved by this Remedy, abstaining also from all Diureticks, which are very prejudicial to big-bellied Women, because they provoke Abortion. If on the other fide this evil arises from the Stone, which prefenting it felf to the neck of the Bladder flops the Urinary Passage, whilst with Child; the must be contented to have it only thrust back with a Catheter: but if it be small, one may try to draw it forth with a small Probe fit for the purpose, putting the fore-finger into the Vagina, to keep it in subjection that it recoyl not back towards the Bladder, which is only to be done to the small ones; for she must be delivered before the great ones can be drawn forth, it being better to leave her in that condition, than to endanger her Life or the Childs, by drawing it.

CHAP. XV.

Of the Cough, and difficult Breathing.

Omen whose Children lye low, are oftner troubled with difficulty of Using Comment troubled with difficulty of Urine(as mentioned in the foregoing Chapter) than they whose Children lye higher, and are indeed exempted from this and the like inconvenience, but then more fubject to a Cough and difficulty of Breathing than the former.

A Cough, if violent, as fometimes, even to Vomiting, is one of the most dangerous Accidents. which contributes to Abortion, because it is an Esfay by which the Lungs endeavour to cast forth of the Breast that which offends them, by a compresson of all its Muscles, which pressing all the inclosed Air inwards, with which the Lungs are much extended, thrusts also by the same means with a sudden violence the Diaphragma downwards, and confequently all the parts of the lower Belly, but particularly the Womb of the pregnant Woman, which Accident continuing long and violent often

causeth her to come before her time.

This Cough proceeds fometimes from sharp and biting Rheums, which distil from the Brain upon the sharp Artery and the Lungs, and sometimes from a Blood of the like Nature, which flows from the whole Habit towards the Breast, upon the suppression of the Terms; as also from having breathed in too cold an Air, which irritates the parts, and excites them to move in that manner; but being begun by these Causes, it is very often augmented by the compression the Womb of the pregnant Woman makes upon the Diaphragma, which cannot have its free liberty in those that bear their Children high, because by its great extension it bears up almost all the parts of the lower Belly towards the Breast, and principally the Stomach and Liver, forcing them against the Diaphragma, which is thereby comprelled, as we have faid.

This may be remedied by the Woman's observing a good Diet something cooling: if sharp Humors cause it, avoiding all Meats salted, spiced, or hautgoust; she must forbear sharp things, as Orenges, Citrons, Pomgranats, Vinegar, and others of the like Nature, because they yet more and more by their pricking quality excite the Cough: but she

may

may make use of Lenitives and fuch as fweeten the Passages, as juice of Liquorish, Sugarcandy, and Syrup of Violets, or Mulberries, of which they may mix fome Spoonfuls with a Ptyfan made with Jujubes Sebestens, Ralsions of the Sun and French-Barly, always adding a little Liquorish to it: It may not likewise be amis to turn the abundance of these Humors and draw them downwards by fome gentle Clyster. If this Regimen prevails nothing, and that there appears figns of fullness of Blood, it will be necessary at whatsoever time it be of her going with Child, to bleed her in the Arm, and tho this Remedy be not usually practifed when they are young with Child, yet in this cafe it must : for a continual Cough is much more dangerous than moderate Bleeding. If the Cough comes of cold, let her be kept in a close Chamber with a Napkin three or four times double about her Neck, or a Lamb-skin, that it may keep her warm; and going to Bed let her take three or four spoonfuls of Syrup of burnt Wine, which is very pectoral, and caufeth a good Digeftion, if it be made in the following manner:

Take half a pint of good Wine, two drams of good Cinamon bruised, half a dozen Cloves, with four ounces of Sugar; put them together in a Silver Porenger, and cause them to boil upon a Chafindish of Coals, burn it, and afterwards boil it to the consistence of a Syrup, which let the Woman take at Night, an hour or two after a light Supper. It must always be observed from whatsoever cause the Cough proceeds, that the Woman go loose in her Clothes, for being strait-laced, the Womb is the more thrust down, by the endeavours the Cough causeth it to make. And because Sleepis very pro-

per to flay Defluxions, it may be procured (if there be occasion) by some small Julip, using by no means the strong Stupefactives, which are dangerous to a Woman with Child, if there be not a very great necessity; as there was in my Kinswoman, who had furious Accidents by the hurt she got from the Stumble, of which I gave you an account in the

12th Chapter of this Book.

There are Women that carry their Children fo high (especially their first, because the large Ligaments which support the Womb are not vetrelaxed) that they think them to be in their Breaft, which caufeth fo great an oppression and difficulty of Breathing, that they fear they shall be choak'd assoon as they have either eaten a little, walk'd, or gone up a pair of Stairs: which comes (as I faid before) by reason the Womb is much enlarged, and greatly present the Stomach and Liver, which forces the Diaphragma upwards, leaving it no free liberty to be moved, whence is caused this difficulty of Breathing. Sometimes also their Lungs are fo full of Blood, driven thither from all parts of the Body when with Child, that it hardly leaves pallage for the Air: if fo, they will breath more easily as soon as a little Blood is taken from the Arm, because by that means the Lungs are emptied and have more liberty to be moved: But if this difficulty of breathing comes from a compression made by the Womb against the Diaphragma, in forcing the parts of the lower Belly against it; the best Remedy is to wear their clothes loose about them; and rather eat little and often, than fill their Bellies too much at once: because it is thereby more presed against the Diaphragma, and so augments

ments the Accident. Neither must she use any viscous or windy Meats, as Pease, &c. but only such as are of an easy Digestion; she must all the while avoid occasion of grief and fear, because these two Passions drive the blood to the Heart and Lungs in too great abundance, so that the Woman, who can hardly already breath, and hath her Breast stuff, will be in danger of being suffocated: for the abundance of Blood silling at once and above measure the Ventricles of the Heart, hinders its Motion, without which one cannot live.

CHAP. XVI.

Of the Swelling and Pains of the Thighs and Legs.

T is very eafy for them that are acquainted with the Circulation of the Blood, to conceive the reason why many big-bellied Women have their Legs and Thighs swelled and pained, and sometimes full of red spots, from the swelling of the Veins, all along the infide of them, which extreamly hinders their going. Many think (which is in fome measure true)that the Woman having more Blood than the Infant needs for its nourishment, Nature, by virtue of the expulsive Faculty of the upper parts, which are always more ftrong, drives the fuperfluity of it upon the lower, which are the Legs, as most feeble and aptest to receive it, because of their scituation: to explain it thus is something to purpose; but I think the Circulation of the Blood will teach us better how this comes, than that we need to have recourse to this expulsive Faculty,

It is then thus, according to my opinion: Following the ordinary motion of the Blood, the Crural and the Saphene Veins receive into them what is brought to the lower parts by the Arteries; and convey it along the Leg and Thigh, aftending still by the Iliacks towards the Heart, which are emptied into the Cava to ascend again by it to the Heart, and fo fuccessively. This being fo de facto (as need not be doubed, fince it is a Verity founded upon Experience) when a Woman is with Child, and chiefly towards the last Months, and the Womb is much extended, and possesset a great part of the lower Belly, then it begins to press the Iliack Veins by its greatness and heaviness, and so hinders the Blood from following its courfe, and having its motion fo free, as before the was with Child; which being fo, the inferior parts, which are the Crural and Saphene Veins, become swelled, much in the same manner as the Veins of the Arm do upwards when bound with a Ligature for Bleeding, or by any strong compression upon the upper parts; which happens, because the Veins being compressed, the Blood is there stopt, finding its Passage more difficult. The Higck Veins being then fo prefled by the bigness and heaviness of the Womb, all those of the Legs and Thighs fwell in fuch a manner, as that they empty themselves into the substance of the parts, and throughout the five Coverings, which thence become fwelled; yea and these Veins, and amongst the rest the Saphenes, dilated and became viscous, fometimes from the inward and upper parts of the Thigh to the very extremity of the Foot, in which the Blood stagnating without its free circulation, is altered and corrupted, which caufeth great

great Pains and Swellings in all these parts. This oftner befalls Women that are very sanguine, walk much, and use great Exercise, which aided with a sulness of the Vein, makes a rupture of the Valvules, which serve to facilitate the motion of the Blood: as the Suckers of a Pump, which retain the Water when it is raised thither: which Blood salling down again, not being so supported, causeth by its quantity and stay, these Dilatations of the

Veins, which are called Varices. For to remedy this, when a Woman hath her Veins dilated, let her only use, whilst she is with Child, a palliative Cure, in Swaithing this Varicospart with a Swaith three or four fingers broad, according to the bigness of it, beginning to swaith from the bottom, and conducting it upwards to the beginning of the Varices, that by this means these Varicos Veins, which are always outward, being moderately closed, should be hindred by this compression from further dilating, and the Blood not be corrupted by the stay it makes there, which after this will not want its circular Motion because the greatest part of it passeth then by the Vessels deeper placed. A Woman in this condition should likewise keep her Bed, if she can, because by this scituation, her Body being equally layed, the Blood circulates much the easier, and is not then fo much troubled to return by these Veins to the Heart, as when it must ascend by them, the Woman standing upright; which is the cause the Legsalways. are more swell'dat Night than Mornings: if there be in any other parts of the Body figns of plenitude and abundance of Blood, they may bleed her without danger.

4 There

There are other Women, whose Legs only swell because of their weakness, and not for the reason inst above mentioned, and are so adematous, that when you press them with your Finger, the print of it remains there; which is, because they want natural heat sufficient to concoct and digest all the Nourishment, sent to them; and to expel the superfluities of it, which by that means remaining there in great quantity, leaves them fo adematous. For, to refolve these fort of Tumors, you may use a Lee made with the Ashes of Vines, and the Decoction of Melilot, Camomile and Lavender; afterwards they may be fomented with Aromatick Wine, in which they may moisten their compresses to be laid upon them, repeating them three or four times a Day to fortify them; which may be made with Rosemary, Bayes, Time, Marjoram, Sage, and Lavender, of each an hand ful; of Province-Roses half a handful; Pomegranat Flowers and Alum, each an ounce; boil them together in strong Red-Wine, three pints, to the confumption of a third part; strain it, and keep it for the use above mentioned. But since Pregnancy for the most part causeth these Tumors, they likewife ordinarily cease when the Woman is brought to Bed, because then she pur' geth forth the superfluity of her whole Habit by means of her Lochia.

CHAP.

painful Inflammations, called Methorshoids, of which long at IVX . A.A. CHeD at long fruit

Of the Hemorrhoids.

THE menstrous Blood, that used to be purged away every Month, being collected in a great quantity near the Womb (which permits it not now to be evacuated by the usual Pallage, being so exactly closed during Pregnancy) is forced to flow back into the whole Habit, and chiefly upon the neighbouring parts of the Womb, and causeth in many the Hemorrhoids both internal and external. All the several forts of them which we shall now describe, may as well happen to them at this time as at another: but we will only speak of that fort which is caused by Pregnancy, because our design is only to make known some particulars of the Maladies Women are in this condition subject to.

Hemorrhoids are Tumors and painful Inflammations, ingendred by a Flux of Humors upon the extremities of the Hemorrhoid Veins and Arteries, and are caused in great-bellied Women by the abundance of Blood cast upon these parts, because the Body at this time is not purged of its. fuperfluities, as accustomed before: it is likewise very often caused by the great endeavours that Women fometimes make to go to Stool when coflive; because the Womb being placed upon the Rectum, hinders by preffing it the Excrements contained in it from being easily extruded: and by these endeavours the Blood, which is in the neighbouring Veffels, being likewise expressed, swells and blows up their extremities, upon which comes thefe painful

90

painful Inflammations, called Hemorrhoids, of which some are internal, some external, some small and with little or no pain, and some extreamly big and painful. This may fuffice for their general differences, without coming to their particulars, which would require a more ample Explication.

If they are finall and without pain, either internal or external, it is easy enough to prevent their firther growth, by Remedies, which hinder and turn the Flux from those parts: but there is more reason to care the great and painful ones, by eafing first the great pain; for as long as that continues, the Flux is ever augmented. To this purpole, if the big-bellied Woman have in the rest of her Body other figns of Repletion, the may fafely be once let blood in the Arm, and fometimes (if there be great necessity) twice, for to turn away the Humors, and to evacuate the fulness, by which the Pain will be likewife appealed : If the gross Excrements retained in the right Gut be the cause of it, and that the be coffive, let her take an emollient Clyfter of the Decoction of Mallows, Marsh-Mallows, Pellitory, and Violets, with Honey of Violets, to which may be added, Oyl of Iweet Almonds, or Iweet Butter; being careful to add nothing that may irritate, lest it augment the Disease, especially when they are inward Piles: And to the end the Women may then the better receive the Clyster, 'tis fit that a small end of a Pullets Gut be put upon the end of the Pipe, to cover it on the outside, that fo it may be put up the Fundament with less pain, afterwards let her keep a moderate and coolingDiet, and continue in Bed till this Flux of Humors be passed, and the mean time anoint the Piles with

with hot Strokings from the Cow, or foment them with the Decoction of Marsh-Mallows, White-broth, and Linseed: Oil of sweet Almonds, Poppies, and Water-Lillies, well beaten together with the yolk of an Egg, and ground in a leaden Mortar, are very anodine and proper to ease pain; and if the Inflammation be great, anoint it a little with Unguentum Refrigerans Galeni, and Populeon, equally mixed.

After a good Diet, Bleeding, and the application only of these cooling and anodine Remedies (Repercussives being not then to be used, lest they repel the impure Blood, or harden the Piles) if their fwelling doth not abate, Leeches must be applied. to draw and empty the Blood there gathered; or they may be opened with a Lancet, if foft, or any kind of Inundation: but Leeches is more proper for hard Piles, and as it were fleshy, because they do not put one to fo much pain as the Lancet: altho fome Men by the help of these Piles, have an evacuation, almost natural being relieved by it when they bleed moderately, Nature being accustomed to it: yet it is not so in Women, but always contrary to Nature; because the evacuation which happens to those Men by the Piles, ought always to be made by the Womb in Women, if not with Child: but being with Child, it may in some manner, in case the Woman be plethorick, supply also the defect of the natural evacuation; for provided they bleed moderately and without pain, she may thereby be also relieved: but if they flow in too great quantity, there is danger that both Mother and Infant will be weakened by it; and to avoid it, tis convenient to make aftringent Fomentations with the Decoction of Granat flowers, the Rinds

tu

of

of Pomgranates and Province Roses, made with Smiths-water and a little Alumior this Cataplasin may be applied to it, made with Bole-armonack, Dragons-blood, and Terra Sigillata, with the white of an Egg: As also to turn back the Blood from these parts by bleeding in the Arm, and by dry Cupping-Glasses, applied to the region of the Reins, and other Remedies convenient for this Distemper, and such as the Accident requires.

CHAP. XVIII.

Of the several Fluxes which may happen to a Woman with Child, and first of a Loosness.

Three feveral Fluxes may befal a great-bellied Woman, to wit, the Flux of the Belly, the Flux of the Terms and Floodings. We shall first speak of the Flux of the Belly, and afterwards we will examine the other two in the two following Chapters.

There are ordinarily reckoned three forts of Loofnesses, which in general is a frequent dejection of what is contained in the Guts, by Stool: the first is called Lienteria, by which the Stomach and the Guts, not having digested the nourishment received, lets it pass almost quite raw. The second is called Diarrhea, by which they simply discharge the Humors and Excrements which they contain. And the third, which is the worst, is Dysenteria, by which the Patient, together with the Humors and Excrements, voids Blood with violent pains, caused by the ulceration of the Guts.

Of what kind soever the Flux is, if great, and continue long, it puts the Woman in great danger

of miscarrying; which Hippocrates tells us in the 34th Aporism of his 5th Book : Mulieti in uterd gerenti, fi alous plurimum profluat periculum est ne abortiat. For, if it be a Lienteria, the Stomach not containing the Food received, and letting it immediately pass away before it be turned into Chyle of which Blood ought to be made for the nourishment of Mother and Child, it is not possible but they must be both thereby extreamly weakened for want of nourishment. If a Diarrhaa, and continues long, it will occasion the same Accident : because there is a great diffipation of the Spirits together with the evacuation of Humors. But the danger is much greater when a Dysenteria, for a funch as the Woman hath then great pains and gripes in the Guts caufed by their Ulceration, which excites them continually by constant stimulations to difcharge themselves of the sharp and bilous Humors. with which they are extreamly annoyed; which caufeth a great disturbance and violent commotion of the Womb, being placed upon the right Gut; and to the Child contained in it, and by the compression which the Muscles of the Belly make on all fides, as also those that are made by them of the Diaphragma, which force themselves downwards in the endeavours a Woman makes fo often to go to Stool with pain, the Child is constrained because of this violence to come before its time, which arrives fo much the oftner, by how much these stimulations and needings are greater, as the fame Hippocrates notes in the 27th Aphorism of his 7th Book, Mulieri utero gerenti, si tensio supervenerit, facit abortum. If there happens a Tenesm (saith he) to a Woman with Child, it makes her miscarry. This

This Tenefin is a great Passion of the right Gut, which forceth it to make these violent endeavours to discharge it felf, without being able to avoid any thing, but cholorick Humors mixt with Blood,

with which it is continually irritated.

When this Flux of the Belly happens to a bigbellied Woman, it is ordinarily, because they have always the Digestion of their Stomach weak, by reason of their bad Diet, which their strange Appetites cause them often to long for: by the continual use of which being at length weakned, it suffers the Food to pass immediately without Digestion; or if it stay longer, it is converted into a corrupted Chyle, which descending into the Guts, irritates them by its acrimony to discharge themselves as

foon as they can.

Now to proceed fafely to the cure of these different Fluxes of the Belly (to which 'tis fit care should be taken in good time, lest the Woman miscarry, as we have already faid) the nature of it must be considered, to the end the cause, which maintains it should be remedied. If it be a Lienteria following (as is usual) continual Vomitings, which have so debilitated the Stomach, and relaxed its Membranes, that having no longer strength to vomit up that Food, it fuffers it to pass downwards without Digestion: In this case a Woman must abstain from all those irregular Appetites, and accustom her self to good Food of easy Digestion, and little at a time, that fo her Stomach may be able the easier to concoct and digest it; she should drink a little deep Claret-Wine, mixed with Water in which Iron hath been quenched, instead of Pryfan, which is not proper in this case, provided fhe

the have not a ftrong Feaver; for if it be but a small Feaver. Wincon this manner is to be preferred, forafmuch as the fewer the bath at that time. is but fyinptomatick, caused by this debility of Stomach, and will vanish as foon as this is fortified: which will be yet more promoted, if the Woman before and after Meals takes fome Corroberatives. as a little of that Burnt-Wine we mentioned for the Cough in the 15th Chapter of this Book; or a little good Hippocras, or right Canary, of any of them according to her Pallat; neither will it be amiss if the eats a little good Marmalade of Quince before Meals: She may likewife wear upon the pit of her Stomach a Lamb-Skin with the Wool, for to preferve it, and augment its natural heat, which is very necellary to digest * Not always a good

all, to give no purging Medicine, when this Flux is only caused by weakness.

lest it be thereby augmented.

Food: * observing above

If it be a Diarrhea, and only an evacuation fimply of fuch Excrements as are retained in the Guts. and some superfluous Humors, which Nature hath fent thither to be expelled, and that it continue no long time, and is gentle; the Woman will find no inconvenience by it; nor is she in that danger as when it passeth those Bounds; and therefore is good to leave the operation to Nature, without interrupting it in the beginning; but if it continues above four or five days, it is a fign then that there areill Humors contained and cleaving to the infide of the Guts, which provoke them often to be difcharged, and ought to be removed with fome purging Medicine that may loofen and evacuate them, after

after which the Flux will certainly cease, some light infusion of Senna and Rubarb, with Syrup of Succory, or an ounce of Diacatholicon, with a little Rubarb for a Bolus, to be taken in a Wafer.

But if, notwithstanding fit Purges and a regular Diet, this Flux continues, and changes into a Dyfenteria, the Patient voiding every moment bloody Stools, with much pain and needing, she is then in great danger of miscarrying, and its prevention ought it be endeavoured, if possible. Therefore, after having purged away the ill Humor, (with the Medicines above mentioned) which were in the Guts, and hindering, by a good Diet, that no more be engendred; to which purpose let her use good Broths made of Veal or Chicken, with cooling Herbs, temper the acrimony of these hot Humors; let her eat Pap with the yolk of an Egg new layed, being well boiled : fuch Diet foftens and fweetens the Guts within. Let her drink be Water, in which Iron or Steel was quenched, with a little Wine, if the be not feverish for then half a spoonful of Syrup of Quince or Pomegranates is better to mix with the foresaid Water; She may likewise eat a little Marmalade of Quince, or other aftringents and strengthners, provided her Body was well purged before: and because there is always in these Fluxes great pains and gripes all over the Belly and Guts and chiefly the Rectum all the Humors being difcharged upon it, which irritating it extreamly, caufeth continual stimulations, that ought to be appeafed (if possible) to prevent Abortion, and may be effected by * Clysters made As before observed, of the Broth of a Calves-head, better omitted. or Sheeps-head well boiled,

mixirg

Shill

mixing it with two ounces of the Oil of Violets or elfe of good Milk, mixed with the Yolk of a fresh Egg. After the use of these strengthning and anodine Clysters, as long as is judged necessary, which the Patient ought to keep as long as fhe can, the better to appeale these pains, you must proceed to the use of Detersives, made with the Decoction of Mallows and Marsh-Mallows, with Honey of Roses; and afterwards aftringent Clyfters, in which must be neither Oil nor Honey mixed, because they relax instead of binding; beginning first with the gentleft, made with Rofe-water, mixed with Lettice and Plantain-water; afterwards to ftronger. composed with the Decoction of the Roots and Leaves of Plantain, Tapfus Barbatus, Horfe-tail, with Province-Roses, the Rind of Pomegranates in Smiths-water; to which may be added, of Terra Sigillata, and Dragons-blood, each two drams. You may likewise foment the Fundament: but there must be care, before you come to use the ftrong aftringents, that the Woman be first well purged with the Remedies before mentioned, left (as the Proverb is) the Wolf be shut in with the Flock; and, endeavouring to prevent Abortion, the death of the Mother, and consequently of the Child, be caused by a greater Mischief: retaining within abundance of ill Humors, of which Nature would willingly be discharged: All which may be avoided, if what I have faid be well obser-

CHAP. XIX.

Of the menstruous Flux.

Hook faith, Si Mulieri utero gerenti Purgationes prodeant, impossibile est fætum esse sanum; If a bigbellied Woman have her Courses, it is impossible the Infant can be in health. This Aphorism must not be taken literally but must be understood when they come down immoderately: for tho according to the most general and natural rule, the Courses ought not to flow when a Woman is with Child, because their ordinary Passage is stopt, and also because the Blood is then imployed for the nourishment of the Infant, of which, if it flows away, it is defrauded, and confequently much weakened: Yet there are some Women, who not with standing they are with Child, have their Courses till the 4th or sth Month; about which time, the Infant being already pretty big draws a good quantity of Blood for its nourishment; wherefore there cannot fo eafily remain a superfluity, as when young with Child. I knew one that had four or five living Children, and had, of every Child, her Courfes duly from Month to Month, as at other times, only in a little less quantity, and was fo till the 6th Month; yet notwithstanding, she was always brought to Bed at her full time. I likewise saw another, who not believing the was with Child, because she had her Courses; and finding her felf out of order, because the had conceived, imagining it was fome other Di-Itemper, prevailed with her Physitian to bleed and

purge

purge her very often, which he did, till he had indeed cured her; but'twas after the had miscarried. being three Months gone. This evacuation usually befals very Sangnine or Phlegmatick Women, who breeding more Blood than the Infant hath need of for its nourishment at the beginning, discharge themselves at those times of that superfluous quantity, more or less, according to their dispositions but not by the bottom of the Womb, as formerly when they were not breeding because those Passages are effectually closed by the after-birth which adheres to it and the Womb is then exactly closes but by a couple of Branches which Nature (provident and careful of the preservation of Individuals as well as of the Kind) hath deftin'd to this ufe which proceed from the Spermatick Vellels, which (besides those they send to the Testicles and other parts) before they arrive at the Womb, divide themselves on each side into two Branches very confiderable; of which, the one terminates in the Fund of the Womb, by which the Courses pass. when the Woman is not with Child; and the other, not entring there, couching along the Body of it, is terminated in the fide of the neck of the Womb. by which the Courfes are discharged, whilst they are breeding, in case the Woman be Plethorick.

When a Woman voids Blood downwards, it must carefully be considered whence it proceeds, and in what manner; whether it is the ordinary Courses, or a real Flooding: If it be the ordinary Courses, the Blood comes away periodically at the accustomed times, and flows by degrees from the neck, near the inward Orifice of the Womb, and not from its Fund; as may be discovered, if try-

ing with a Finger one finds the inward Orifice exactly closed; which could not be if the Blood proceeded from the bottom, as also if it proceeds without pain; all which circumstances do not meet in a Flooding, but others very different as will appear in the following Chapter. It must likewise be confidered, whether these Courses flow, only because of the Superfluity, or because of the acrimony of the Blood, or the weakness of the Vessels which contain it, that so sit Remedies may be applyed. If they proceed from the fole abundance, being more than the Fruit can confume for its nourishment, it is fo far from hurting either Mother or Child, that being moderate, it is very profitable to them; because, if the Womb were not discharged of this superfluous Blood, the Fruit which is as yet but little, would be drowned by it, or, as it were, fuffocated: And if it should chance that they were unduly fropt or retained, bleeding will fupply the defect of the natural evacuation, which ought to have been; but if there be no fign of abundance or plenitude, and that before the was with Child the had her Courses in a small quantity, which still continue to flow after the hath conceived, it is a fign that the Flux proceeds from the heat and acrimony of the Blood, or the weakness of the Vessels appointed to receive it. It is of this fort of Women that Hippocrates pretends to speak, in the 6th Aphorism before mentioned, whose Children cannot be healthful, when their Courses flow, while they are breeding; because there remains not Blood enough behind for her, and the nourishment of her Infant, which puts her in great danger of miscarrying, for as the Proyer faith, Hunger drives the Wolf

Wolf out of the Wood; to likewife want of nourishment forceth the little Prisoner out of his hidingplace before his time, DANE and roball bus books

To hinder this Flux from effecting fo evil and finister an Accident, the Woman must keepher self very quiet in Bed, abstaining from all things that may heat her Blood, shunning Choler above all the Passions of the Mind, using a strengthning and a cooling Diet, feeding on Meat that breeds good Blood, and thickens it; as are good Broths made with Poultry; Necks of Matten, Knucles of Veal, in which may be boiled cooling Pot-herbs; newlay'd Eggs, Gellies, Rice-milk, Barly-broths, which are proper for her: let her Drink be Water in which Iron is quenched, with a little Syrup of Onince: The must refrain from Copulation, because by hearing the Blood it excites it to flow more. If notwithstanding all this the Flux continues, some commend large Cupping-Glassesunder the Breasts to make a revultion, and to turn the Blood; according to Hippocrates Aphorism 50 of the 5th Book, Mulieri fi velis menstrua sistere, cucurbitulam quam maximam ad Mammas appone: but it will do no great matter; however, to fatisfy the Patient, and to flew that nothing is omitted that may make for her Cure, they may be applied. I should rather choose to make this Revulsion by Bleeding in the Arm, if her Strength permitted ! And because in this condition the Child is very weak through this great evacuation, it must be fortified by applying to the Mothers Belly about the region of the Womb, Comprelles steeped in strong Wine, in which is boyled a Pomegranat, with its Peel, Provence-Roses, and a little Cinamon: but the best

Blood, and hinder its Evacuation.

Ist rend of CHAP. XX.

of Floodings.

There is a great difference between the menfiruous Blood, of which we have discoursed
in the preceding Chapter, which happens sometimes to Women with Child, and this Flooding
which we have now in hand: for (as I have said)
the Courses come periodically at the times accustromed, without pain, distilling by little and little
from the neck of the Womb, during pregnancy,
after which it totally ceaseth: but much the contrary, this loss of Blood comes from the bottom of

* Sometimes. the Womb, with * pain, and almost of a fudden, and in great a bundance, and continues Flooding

daily without intermission, except that some Clods (formed there) which seem sometimes to lessen the Accident, by stopping for a little time the place whence it flows; but soon after it returns with greater violence, after which follows death both to Mother and Child, if not timely prevented, by delivering the Woman, as shall be hereafter declared.

If this Flooding happens when young with Child, it is usually because of some False-conception, or Mole, of which the Womb endeavours to discharge it self, by which it opens some of the Vessels in the bottom of it, from whence the Blood ceaseth not to flow, untill it hath cast forth the strange Bodies it contained in its capacity and the

hotter

hotter and fubtiller the Blood is then, the more abundantly it flows. But when this Flooding happens to a Woman truly conceived, at whatfoever time it be, it proceeds likewife from the opening of the Vellels of the fund of the Womb, caused by fome blow, flip or other hurt, and chiefly because the Secundine in fuch cases, and sometimes in others, is separated in part, if not totally, from the infide of the bottom of the Womb, to which it ought to adhere, that it might receive the Mothers Blood, appointed for the Infants nouriture, by which feparation it leaves open all the Orifices of the Veffels where it was joined, and fo follows a great Flux of Blood, which never ceaseth (if fo caused) till the Woman be brought to Bed : for the Secundine being once loofened, althobut part of it, never joins again to the Womb to close those Vessels, which can never thut till the Womb hath voided all that it contained: for then compressing and closing it felf, and as it were entring within it felf (as it happens presently after Delivery) the Orifices of the Vessels are closed and stopt up by this contraction, whereby also this Flooding ceaseth, which always continues as long as the Womb is distended by the Child, or any thing else it contains, for the reason aforesaid: much like to a Spunge, whose Pores or Holes being very large when swelled, disappear and close with their own substance when squeezed and compressed; so likewise by this contraction of the Matrix(which during pregnancy became as it were fpongeous) in the place whence the Secundare was feparated, the Orifices of the Vessels are closed, affoon as it is cleanfed from what foever it contained in its capacity.

G 4

Althe

Altho I have faid that a Woman in this condition, for the reasons alledged, must necessarily be delivered, that the Flooding may be stopt; I do not intend it should be done assoon as perceived: because some small Floodings have sometimes been suppressed by keeping quietly in Bed, bleeding in the Arm, and the use of the Remedies specified in the precedent Chapter; it may likewife be but an ordinary and menstruous Flux. If then the Blood flows but in small quantity, and continues a little while, itis good leaving the labour to the work of Nature, provided the Woman hath fufficient Strength and that is be accompanied with no other evil Accident; but when it flows in fo great abundance that the falls into Convultions and Faintings, then the operation must not be deferr'd; and'tis absolutely necessary The should be delivered whether the be at her Reckoning or no, whether the have pains or throws, or not; because there is no other way to fave her Life and the Childs, but prefently to do it Externam fundet cum sanguine vocem; the gafts forth with her Blood her last Breath. Hippocrates knew very well the danger of it, when he faid in his 56th Aphorism of the 5th Book, In fluxu muliebri si convulsio & animi defectus advenerit, malum: If Convultions and Faintings follow Floodings ditis a bad fign. The world

There must not always in these unfortunate Accidents be expected pains and throws to force and bear down to forward labour; for the they come at the beginning, they usually cease assoon as the Flooding comes to Synappe's and Convulsions; neither must it be deferr'd, till the Word be enough opened, forafmuch as this effusion of Blood very

much

ftop

much moistens it, and the weakness relaxeth it so that it may be then as early dilated as if there had been abundance of strong throws. Wherefore, having placed the Woman in the scituation we shall direct when we treat of Deiveries, let the Chirurgeon having his Hands anoisted with Oil or fresh Butter, introduce his Fingers joined together, by degrees into the Matrix, and firead them, open the one from the other when they are in the entry, for to dilate it sufficiently by littleand little, without any violence, if possible ; which being done, and his Hands quite within if he finds the Waters not broke, let him break them, and then, what foever part of the Child prefents, tho the Head (provided it be not just in the Birth) les him search for the Feet, and draw it forth by them (observing every circumstance that shall be shewn in the 14th Chapter of the fecond Book, where is described the way how to deliver a Woman, the Child coming with the Feetfirst because there is better hold, and more easy to deliver by * Without it could be them, * than by the Head or done withour Hooks. as any other part of the Body. mentioned in the Preface of the Translater. Wherefore if the Feet lie not ready, the Chirurgeon must feek for them, which at that time is easier done than at another because the great Flooding makes the Womb loofe and Slippery by its Humidity, so that it will not be difficult for him to turn the Child and bring it by the Feet, as we have even now faid; after which he must fetch the after-burden, which in these cases cleaves but little, being careful not to leave for much as a Clod in the Womb, left it still continue the Flooding, which being done, it will foon after

ftop with all the Accidents, if too much time was not spent before the Operation.

Many Women and Children have perished for want of this Operation in this ill Accident; and many others have escaped Death, (which else most certainly had followed) by being timely succoured.

Deliveries, makes mention of fix or feven Histories to confirm this verity, in some of which we may find the Women and their Children bloody victims of it, for not having been in the like case delivered, which others, by a seasonable Delivery, escaped: and the better to confirm it by my own experience, I will recite you one amongst the rest, very remarkable, of the remembrance of which I am so sensible, that the Ink I write with at present to publish it to the World for their profit, seems to me to be Blood, because in this sad and fatal occation, I saw part of my self expire.

About three Years fince one of my Sifters, not yet one and twenty Years of Age, being about eight Months and a half gone with her fifth Child, and then very well in Health, was fo unfortunate as to hurt her felf (tho at first small in appearance) by falling on her Knees, her Belly a little touching the Ground by the Fall, after which the passed a Day or two without perceiving any greatalteration, which made her neglect to repose her felf, being very neceffary for her; but the third day, or thereabouts, after her hurt, about eleveninthe morning, the was fuddenly furprized with strong and frequent pains in the Belly, which were immediately followed with Floodings; this made her presently fend for her Midwife, who no better understanding her Office,

Office, told her she must have patience, till the Womb had dilated it self by the pains, before she could be delivered, assuring her further that she had no reason to be afraid, and that she should be quickly freed from the danger, because her Child came right: she made her thus hope in vain three or four hours, until, the Flooding still continuing violently, the pains began to cease, and the poor

Woman fell into frequent Faintings, * and then the Midwife desired a Chirurgeon to advise with in this case: they immediately sent to my

* When the danger was obvious to every Body, but Midwives ought to discover the danger sooner.

House for me, but unfortunately missing of me, they sent for him, whom they judged the ablest of all the Chirurgeons that practised Midwifery in Paris, and immediatly conducted him to my Sisters, where he arrived about four in the Afternoon,

where he arrived about four and having seen her, tontented himself with only saying, she was a dead Woman, and that nothing was to be done
to her, but to give her all the Sacraments, and that absolutely
she could not be delivered;
which likewise the Midwise
jointly concluded, who believed that the opinion of a Man
so authentickly esteemed of all, must be infallible. Asson
as he had delivered this Prognostick, he immediatly re-

+ It were to be well'd ather than hoped for, that Practitioners in this and other the like dangerous case (whereof they have no certain bnowledg) would confult, and not d frog one or more, by undertaking what they cannot well perform, or discourage Patients from Sending for other help and advice; putting Life in ballance with their Reputation.

nostick, he immediatly returned home, and would by no means stay longer, but left this young Woman in that deplorable condition without any fuccour, whose Life he had certainly faved with her Childs, if he at that time had delivered her, which was very eafy to be dorte, as will plainly appear by the fequel of the History. After the advice of a Person of so great Reputation, together with that of the Midwife.

beeb bappen by the Prognosticks of such who have the luck, the they want the merit to be eftermed.

The great mischiefs fince Monsieur N. * could do nothing, there was no other Remedy for fo great a danger, but to hope in God awho is Almighty. They therefore endeavoured

to comfort my poor Sifter as well as they could who longed for nothing more than to fee me, to know whether I would pass the same sentence, and whether her danger, which still augmented more and more, was without Remedy (for her Blood flowed away continually in great abundance.) At length I returned home, where they had been long before to tell me this bad News, tho by misfortune could not find me (as I faid before) which as foon as I understood, I immediatly hastned to her with all possible speed, where I saw assoon as I came in, fo pittiful a Spectacle, that all the Passions of my Soul were at the instant agitated with many and different commotions; having afterwards a little recovered my Senses, I drew near to my Sisters Bed, where they had just given her the last Sacraments, and she conjured me very often to give that faccour, which she said she only expected from me. After that I had understood from the Midwife all that had paffed, and the opinion of the Chirurgeon, that had feen her above two hours before (for it was then fix a clock) I perceived the Blood

to flood continually in great abundance and without intermission, of which she had already lost above three Ouarts: and which was very

French Quarts are English Possies.

remarkable, above twelve small Porengers, in the two hours after the Chirurgeon was returned, as it feemed to me by the number of Napkins and other Clothes, which were all muck wet with it : which Blood had stayed in her Body and faved her Life, if she had been then delivered: I faw likewife that she grew every moment weaker and weaker, which convinced me that she was then in more danger than she would have been if they had not let flip the opportunity of delivering her two or three hours before, as it was possible and eafy; because she had then almost all her Strength the afterwards lost with the rest of her Blood, which all along flooded away; and defirous to know whether they could have delivered her. I found, by trying her Body, that the inward Orifice of the Womb was dilated in fuch fort that beould eafily introdue two or three Fingers, and having marked it. I made the Midwife try again to fee whether the Orifice was fo disposed when the Chirurgeon faid that the could not be delivered, and whether the was of his opinion. She told me it was fo, and that it had been always in the same condition from the time of his departure. Assoon as the had made me this Declaration, I easily perceived his Ignorance, and where the Shoe wring'd him.

Wherefore I told her, that I wondred much they were both of that opinion, feeing that in truth it feemed quite contrary to me, because it was at that time most certainly very easy for him to have de-

livered

D97341

livered her, if he had pleased, as it still was, and what indeed I would have done at that very moment, if it had been possible for me to have had power enough over my Spirit, which wavered a long while about the Resolution I was constrained to take after I had lost the hopes of all other help. That which hindred me, was not so much the Prognostick, that so famous a Chirurgeon had made, in persuading all the Assistants, that she could not be delivered, (tho it might feem rash to oppose the Sayings of fuch as are esteemed Oracles) neither was it the little Strength the Patient had then left: but it was chiefly the Relation of the Person, being my Sifter, whom I tenderly loved, which troubled my Spirits with fuch different Passions, to see her before me ready to expire through the prodigious loss of Blood, which proceeded from the fame fpring as mine own, that it was impossible for me at that moment to resolve, and obliged me to fend again to the Chirurgeon (who not long fince returned home) to entreat him to come back again to the House, that (my felf demonstrating to him the facility I found for the operation, and make him understand and confess that in those cases there is no hope, unless it be undertaken as foon as may be) I might perfuade him to deliver her, rather than to abandon the Mother fo, to the despair of her Life, as he had done, and to fuffer the Infant to perish with her unbaptized; which had been prevented if he had done what Art required which is at least (when both cannot be faved) to favethe Child, if possible, without prejudice to the Mother, which was very eafy, as you shall prefently understand : But no Prayers nor Sollicitati-OIS

ons could ever pevail with him to return, excufing himfelf that it was impossible for him to do any thing in th/cafe. When this was related to me-I fent yet agan to another Chirurgeon, one of my Companions being a little more obliging and ferviceable, hom, if he had come time enough, I would have convinced of the necessity of the Operation, and made him acknowledg the facility of it: butoy misfortune he was abroad. During all these roings and comings, there was an hour and half pent, which time she flooded without intermission, and her weakness grew more and more: wheefore feeing my felf without hopes of getting the Persons I sent for, I resolved to deliver her preently, which before was beyond my power, forthereasons recited, and indeed was now a little too late for the Mother; for, if I could have commended my Passions to have done it at the instant I arrived there would then have been great hopes to have faved her as well as I did the Child : After I had thus prepared my felf for it, that is, having directed two of my Fingers into the inter Orifice of the Womb, being open enough to admit them into it. I did in a little while after introduc athird, and by degrees the ends of all the five of by right Hand, with which I dilated the Orifice fuficiently to admit it quite in, as it is very easy in he like case, because the abundance of Blood moisters and relaxeth extreamly (as is already mentiond) the whole Womb, into which having fo gently atred my Hand, I found the Child came right, and the Waters not yet broken; wherefore I preintly broke the Membranes with my Nails and Finers, and then turning the Child, I took it by the leet, and

and brought it forth very easily after the manner I shall teach in the forementioned 1 40h Chapter of the 2d Book, all which I finished intess time than a hundred could be counted, and do onfcientiously protest never to have delivered a Woman sooner in all my Life, of those whose Children came against Nature, nor easier, and with less violence to the Mother, who did not in the least conplain during the Operation, altho she had her Seifes very well, and exactly knew all I did to her, and found her felf very much comforted as foon as ever the was delivered, and immediatly after the flooding began to cease: As to the Child I brought it slive, and it was presently baptized by a Priest that was in the Chamber. The poor Patient, and all the company present (which were in great number) found then manifestly that the Chirurgion and Midwife, who faid she could not be delivered, had but little reason to assure any such thing.

The Operation was finished time enough for the Childs bapufm, which (praifed be God) it received; but too late to fave the Mothers Life, who (having before left all her Blood) dyed an hour after the was fo dlivered by the same weakness that she often fell/nto before the was delivered. The flooding indeedceased presently, but she had not Blood enough left to enable her to refift those frequent Fainings, which the might have done as may probablibe conjectured, if the Chirurgion that first faw er had delivered her three long hours before, as whout doubt he might as eafily have done as I;

+ ich Porenger con-

in which time she lost above rain about four Oun- twenty * Small Porengers of Blood, of which four or five

possibly

possibly might have been sufficient to have faved her Life, she being a young Woman of a very good Constitution, having no inconvenience or sickness when she was surprized with this fatal Actident, which befel her (as aforesaid) about eleven in the Morning, and she was delivered about seven at Night; and because she had lost so much Blood before the Operation, it proved unprofitable, she dying an Hour after, having her perfect Senses to the moment she expired, which was about eight

the fame Night.

I will upon this lamentable Subject (to the end more care may be taken in the like cases)examine, by way of Digression, what might be the Motive of this proceeding of the Chirurgion, and of fome others of the fame Humor. It must necessarily be agreed, that it was for one or more of these three causes, why either he would not, or could not lay this Woman when he faw her two hours before me, which (as I noted before) might easily have been done: It was either through Ignorance, Malice, or Policy: To imagine it is his Ignorance, I cannot persuade my self, because he hath too great Reputation for that, altho many Persons that understand the Art very well, eafily agree with me, that he is of the number of those, of whom may justly be faid, Minuit presentia famam. That it was through Malice, who can imagine a Man of so detestable a resolution could be found! But if it were neither Ignorance nor Malice, it is easy to guess it a dampable Policy, qualified by some with the Name of Prudence; * this false Prudence * A good Warning not to

rely roo much upon the advice of fuch famous Practitioners, or Midwives, that prefer their Reputations above their Conferences.

they ordinarily use, that are in great Reputation, ever endeavouring to their utmost to shun dangerous Cures, left they that understand not the Aft. should quit the good opinion they had of them, when it happens that the Patient dies under their Hands, altho they were carefully and duly delivered. This was just our misfortune, for this Chirurgion, who was very much esteemed by many Wo. men of Quality whom he delivered, avoided, all he could, dangerous Labors, subject to ill Success. as this was; and the rather then because there was in my Sifter's Chamber a Lady of Quality, Wife to one of the chief Captains of the Guards, who dwelt in the fame House, and whom he ordinarily delivered; which was the cause, that, believing the illue of the Operation doubtful he chose rather to preserve the esteem of his antient Practice, amongst such as understood not the business so well as to be judg of his proceedings, than to do in this case his Christian duty: to which one ought always to have more regard, than to all the Interests of vain Reputation, which usually corrupts the Conscience. They that make use of this Policy are often accessory to the death of poor Women who call for their assistance; and of their Children also.

I was willing to recite every circumstance of this Tragedy, that one may know in the like case the necessity of a speedy Delivery. I have since that had many in the same case, to whom (by the assistance of God) I warranted the lives of the Women, and saved the Children; of which I had in my self more satisfaction, than I could have gained by all the Honour the World could procure me by so wicked a Policy; which neither Chirurgion nor Mid-

Midwife of an upright Confcience will ever ufe. Now fince in all Floodings, there ever follows Weakness and Faintings, we must endeavour to preferve that little Strength the Patient hath left. and augment it if possible; that so they may have fufficient to endure the Operation, and to escape afterwards: to which purpose there ought to be given her, from time to time, good strengthning Broths, Gellies, and a little good Wine: The mult always fmell to Rofe-Vinegar, and have a warm Toast dipt in Wine and Cinamon, applied to the region of her Heart; which will do her more good than folid Food: for, as Hippocrates faith in the 1 1th Aphorism of his 24 Book, Facilius est potu refici, quam cibo, one is sooner nourished by drink than Meat; because the liquid Aliaments are much fooner distributed than the folid: And to prevent the Blood from flooding in great abundance till the can be delivered, * a Vein

in her Arm may be opened, to turn a little the course backwards; and apply all a long her Reins, Napkins wet

in Water and Vinegar. But if the Flooding proceeds from the separation of the after-burthen from the Womb as my Sisters was, all these things are to little purpose; and the best expedient is to deliver the Woman assoon as may be, tho she were but three or four Months gone with Child, or less; because all ought as well to be brought away, whatever is within the Womb, whether it be False-conception, Mole, or Child, without leaving any thing behind, which when it is quite cleared, closing and contrasting it self, stops the Flooding, for the rea-

H 2

fons above alledged, and all Accidents which were caused by it; whereby the Woman afterwards recovers, if there be but fufficient Strength remaining after Delivery, as certainly will be, if not delayed too long. to endere use Operatory, and legal

CHAP. XXI.

Of the weight, bearing down, or relaxation of the Matrix, which binders a Woman with Child in her Walking, and freedom of Coition.

Many Women with Child find an extraordina-ry weight at the bottom of their Bellies; which comes, because the Womb, by the weight it contains in its capacity, bears down upon the neck, and fometimes fo low that they cannot walk without pain and ftradling; at which time also they cannot use Copulation but with great inconvenience.

The bearing down of the Womb, is when it only falls into the Vagina, without coming in the least forth of the Privities, for then it is called the fallingout, or Pracipitation; which is a more trouble form and dangerous Difeafe, & doth not usually befal Women withChild, because the extent & bignessoftheWomb hinders it; that it cannot fall out, but only bears down. The Precipitation is difcern'd by the view; and the bearing down easily, by putting up a Finger into the Vagina; for there the Womb will be soon met with, & its inner Orifice, which is very near the Privities, especially when the Woman stands upright.

* Always. † Numb. 4.

This bearing down, is * often caused by the relaxation of the + Ligaments of the Womb, and chiefly

the * large ones, which ought to fasten it on each side towards the Loins to prevent it; which relaxation comes either from the weight of the burden it bears and

e

ds

if

d

t

contains within, constraining these, Ligaments to be extended more than ordinary; or from fome + Fall, which by much shaking of it produceth the same effect, and fo much the easier, by how much the burden is grea-

" He meant the flat ones, in opposition to the round ones.

A Fall cannot caufe the bearing down any ather way than by streining the Ligaments; The same is to be said of Pains or bad Labour,

ter; and likewise from great Pains or bad Labour which preceded the prefent Pregnancy: or very often it is caused, or at least facilitated, by abundance of Humors, which moistning the Ligaments, relax them in that manner, to which the phlegmatick are very subject, who usually are much troubled with the Whites.

Besides the hinderance which the bearing down of the Womb caufeth to the Womans walking and use of Coition (as we have above mentioned) it caufeth likewise by its weight, principally towards the latter end of her Reckoning, a numnels in her Hips, fleepiness in her Thighs, as also difficulty of Urine, and going to Stool: because by bearing

down it preffeth down the * Bladder, and the great † Gut, between both which it is scituated. The Patient

Rather the neck of the Bladder. + Reaum.

may be much easier cured of this bearing-down, after she is brought to Bed, than whilst she is with Child; for being freed from its burden, its Liga. ments will be the easier fortified: besides she may then use Pessaries to keep it in its place, which cannot fo well be done when she is with Child.

From what cause soever this bearing-down proceeds, the best Remedy for a big-bellied Woman is to keep her Bed, because the weight of it doth more and more relax the Ligaments when she is up: And if she hath neither the means nor convenience so to take her relt, at least let her, if her Belly be big enough, as it is towards the latter end of her Reckoning, wear a Swaith very broad and fit for the purpose, that by this means the burden being a little supported, the Ligaments may not be so much stretched and lengthned; and if she have a difficulty in making water, let her when the would do it, help her felf by lifting up with both Hands her Belly before, which will be a great eafe, and hinder the neck of the Bladder from being fo much compressed; but if the Humors cause this relaxation of the Ligaments of the Womb, the must keep her felf to a drying Diet, her Food being rather roafted than boiled, and must refrain copulalation. The Woman must not be strait-laced.

* because that also forceth down the Matrix : and above all, when she is in Labour, care must be taken that neither by means of the Throws, which strongly force down the Womb, nor by the birth of the Child, nor the violent extraction of the Burden, the gets a Precipitation instead of a bearing down: which is soon done, as is feen often, when the method I teach in the 16th Chapter of the second Book where I treat of this Labour) is not well observed.

CHAP. XXII.

Of the Dropsie of the Womb, and the adematous Tumours of the Lips of the Privities.

Here are many Phelgmatick Women, who certainly believing themselves with Child, void nothing but Water, which was collected together in their Womb, and is called the Dropfie of the Womb. It hath often happened that fuch a Disease hath deceived the Midwives as well as the Patient, who having a long time hoped, and bin indulged in their hopes of a Child, at length instead of it, find nothing but clear waters; as it once did to that Wood-Merchant (I mentioned in the 13th Chapter of this first Book) who at the end of nine or ten Months, labouring under fuch a false Belly, voided a quantity of these Waters, being all that was contained and inclosed in the Womb. Guillemeau in the first Chapter of his first Book of Labours, makes mention of the like History, of one Madam du Pescher, who voided a pailful of Water, certainly believing her self to be with Child: And Fernelius in the 15th Chapter of his 6th Book of Pathlogie, recites a case much more wonderful concerning these Dropsies. He tells us that he saw a Woman who at the times of her Purgations, cast forth by the neck of the Womb, so great a quantity of Water, very hot and yellowish, that she filled fix or feven Basins, and voided so much of it that her Belly grew flat, after which her Courses came immediately in order; and in the following H 4 Months

Months the like quantity was again collected, which afterwards came away as before, and that this Woman (which is most observable) being cured of this Indisposition, conceived with Child, and was brought to bed of a living Child.

These Waters are either bred in the Wombor brought thither from some other part, as in the Dropfie of the Belly it passeth by Transudation through the porous fabitance of the membranes of the Womb. They are bred in the Womb, when it is too cold, or too much debilitated by an ill and violent Labour preceeding; or, because the filth, as Whites, or other Superfluities which it was accustomed to discharge it self of, hath a long time been suppressed. When the Waters contained in the capacity of the Womb have been fent thither from elfewhere, they are then never wrapt in a particular membrane, but only retained by the exact closure of its Orifice, and flows away as foon as it begins to open: but when they are bred in the Womb (which is for the most part after Copulation, if the Seed be either too cold, waterish, or corrupted they are then fometimes contained within membranes, which hinders the Patient from a specdy discharging of it, she going with it as long almost as with a Child: and this is the Dropsie which perswades them sometimes they are with Child.

Tis easie to avoid the mistaking the Dropsie of the Womb for a Child, by careful observing all the figns mentioned, in the Treatife of a true Conception, which concur not in this Diseasc. The Patient

hath indeed her Belly fwell'd, Not always in either, and her * Courses stopt in this case as well as if she were with

case, but eftener when newly with Child.

with Child, but there are many things which will discover to us the difference; for in the Dropfy, her Breafts are flabby, foft and fallen, the will have no Milk in them, nor find her felf quicken at the ordipary time, but only as it were a bubbling of agitated Waters; she feeleth a greater pain and weight in her Belly, which is likewise more equally in its circumference extended, than if there were a Child; the Lips of the Womb, her Thighs and Legs will be swell'd and ædematous; and a worse colour in her Face, than when with Child. Now as this Dropfie may come alone, fo likewife may often happen together with a true Conception, these Waters, being then contained without the Membranes of the Child in the cavity of the Womb; for tho there may be much Water within these membranes, it is not properly the Dropsie of the Womb, because there must ever naturally be some, in the midst of which the Farm is contained: Not withstanding, sometimes there is fuch a quantity, which doth fo prodigiously fwell the Womans Belly, that one would believe she had two or three Children, when she hath but only one, which is much weakened by it, because the

greatest part of its Nourishment is * resolved into these Waters, which almost extinguisheth and suffocates that little natural heat which

*Rather the Waters hinder the Mothers noutishment and con equently of the Fætus.

is there. Some Women have evacuated three or four quarts above two Months before they were brought to bed; when this happens, they are then contained in the * Womb * Amnios & Chorion;

yet not without a peculiar Membrane, otherwise they would berne stowed as they came. Without

without the Membranes; for else the Child would be necessitated to be born presently after these Evacuations *, if it were the Waters (naturally *That being the right contained in the Membrantime of Labour. ces) that came away.

The best Remedy for this kind of Dropsy, the Woman being with Child, is to wait with patience the hour of her Delivery, observing the mean time a drying dyet: but when it is only Water contained in the Womb, she must use Dinreticks, causing the Womb to open and evacuate them; and her Courses must be endeavoured to be provoked, having always a care to destroy by convenient Purges, the cause of the Generation of such Superfluities.

The Womb is sometimes so full of these humours. that it dischargeth some on the outward parts, and principally upon those which are near, as the lips of the Privities, which often are thereby fo fwelled, that they become quite blown up; and sometimes in some Women are so big and swelled, that they cannot close their Thighs together for them, which hinders their walking, unless with pain and great inconvenience. This Swelling is then livid, and almost transparant, even as a Hydrocele; because of the quantity of clear Water which filled it : and because it may be painful and inconvenient to the Woman during her labour by reason they straiten the passages, it will be necessary to remedy it before; which, for the greater certainty, must be done by the operation of the Hand, making many Scarrifications with a small Incision Knife all along the Lips, whereby the humours will fweat out and distil forth by little and little; after which Compresses, dipt in Aromatick and Astringent Wine,

must be put upon it to prevent Relapses, by fortifying the parts, causing the Patient to observe
all the while a good dyet fit for the Dropsie. Some
would apply Leeches, to avoid the pain of the
Knife: but they are not so proper, because the
small Orifices they make, assoon as they are taken
off, immediately close again, which happens not so
soon to the Scarrifications, made as big or little as
one will, and may be kept open by Ointments applied to them, as long as may be thought fit or
necessary. A Seton with good Success hath been
applied.

CHAP. XXIII.

Of the Venereal Disease in Women with Child.

IT is not very hard to imagine, how a breeding-Woman that hath the Pox can comunicate it to a Child inher Belly, because this contagious disease corrupting all the mass of the Mothers Blood, it is necessary the Infant, which hath then no other sustenance, should be insected with it, converting this bad Blood into its own sustance, the Acrimony of which Blood easily causeth in an Infant's tender Body those malignant Ulcers, which all Children, whose Mothers are contaminated with it, usually bring with them at their Birth. It breaks not out sometimes before the Child is 5, 6, 7, or 10 Months old.

The Pox which in its essence is of the same species, and is only distinguished by degrees according as it is greater or less, communicating it felf by the means of the Mothers Blood, will make more or less impression

impression on the Infant's Body according to its strength or weakness; and if the big-bellied Wohave Ulcers very near the Womb, as in the neck and neighbouring parts, by this Proximity the ventom will be very easily conveyed to it. [No easier

than if remote.

I do not defign here to enquire into the bottom of this Venereal Difeafe, nor to write particularly of the cure of it; but intend only to shew whether Women may undergo the Cure whilst with Child. or ought therefore to defer it till after they are brought to bed. That this may be the better determined, we must make some distinction: for, when the woman is towards the end of her account, it ought to be deferred till after she is brought to bed, when both fhe and the Child, if infected, may be taken in hand; because the labour coming on, when the Woman is in the midst of her Cure, the may run the hazzard of her Life: and besides, if the Child should be then still-born, one would be apt to think it was killed by the violence of the Medicaments, and accuse the Chirurgeon of rashness.

When the Pox is but in the first degree, and hath caused no great accidents, one ought then likewise to remit the eradicating Cure till after Childbed, and becontented only with the palliating by a convenient dyet and gentle Purgers from time to time, to prevent the evils encreasing: but if the Woman when young with Child, hath the Pox in the highest degree, accompanied with very great and continual accidents, which threaten danger, if her Cure be protracted till after Delivery; (because in so long a time these accidents augmenting more and more, it would be impossible but her Fruit should be corrupted,

rupted, and very hard if she did not miscarry): that the greatest of these two evils be avoided, she having strength enough, ought to be taken in hand: for, to imagine the worst, that the Remedies make her miscary, it is no more than the greatness of the Disease would otherwise certainly do. Let her then be taken in hand, without suffering the accidents longer to augment, which by continuance render themseves much more dangerous both to her and her Child, being careful to give her the gentlest Remedies, and with more preparation and circumspection, so that the Evacuation procured to her by Salivation, be rather by *Which Courses ought*

by Salivation, be rather by
*little at a time, and the longer, than too great and fudden; and above all, that it
be rather by anointing the
upper parts only with || Mer-

As Unquentum Ne-

curial Oyntments, and not by Perfumes, which fooner endanger miscarrying, by opening the Womb; besides, that they sooner cause the Fruit to perish if it had Life. For the same reason also, no Mercurial Medicine must be taken in at the Mouth: wherefore frictions of the upper parts are to be preferred, endeavouring always, as much as may be, to the Masters of the Evacuation, and to hinder it from causing a Loosness; for that is more dangerous than Saliva-

tion, * because of the continual forcing downward in

* The Flux is not otherwife kind.

going to stool, by which the Word receives great Commotion, and is extreamly agitated.

I know very well that many will not eafily be perswaded, but that either it is impossible to cure

a Woman of the Pox whilft the is with Child, or that the and her Child cannot undergo the Remedies without inevitable danger of death: however the Experience I have had of it my felf, make me to be of another Opinion, which I am willing to communicate for an Example in the like cafe. In the Year 1660, when I practifed Midwifery in the Hoftet de Dien at Paris, a young Wench not above twenty Years old, came thither to lie-in of her fecond Child, that had had the Pox before ever the conceived the first time, and after miscarried of a dead Child, rotten with the Pox; therefore being big this second time, and perceiving the accidents of her Disease to augment more and more, he concluded there was no hopes this great Belly would fucceed any better than the first, because the had all over her Body, especially upon both her Breafts, very many malignant Ulcers, which encreased daily and fearing it might turn to a Cancer before her Reckoning was compleat, being but three Months gone, the refolved to Submit to a thorough Cure then, and to hazard her Life in that condition to fave her Child's, having no other hope to effect it nor being able herself to resist the grow. ing disease. She acquainted three or four Chirurgeons both with her disease and design, not at all concealing her great-Belly; who for that cause would not undertake her, (altho fhe was fully refolved upon it, and promised to pay them well) telling her that their Conscience would not suffer them to do it in the condition she was in, and that it would be better she would patiently submit to it aswell as the could, till the was brought to bed, and then they would very willingly undertake her : But when

when the found none would undertake her, unless the concealed her great-belly, which was not hard to be done being but 3 Months gone, and believing there was no better an expedient: She met with another (to whom she mentioned nothing of her great Belly) that put her into the ordinary course, as if there had been no Conception; and, besides the common Remedies used in this Disease, he gave her a Salivation by five or fix reiterated Frictions of the Ointment, which followed her very plentifully five whole Weeks, fo that she was well and perfectly cured without leaving the least ill Accident behind of her Difeafe. When the was almost recovered, and that all had succeeded well, she told her Chirurgion the was 4 Months and a half gone with Child, (for the was 3 Months when the came to him, where the logded fix Weeks intire, without having it in the least perceived) which at first he could hardly believe, but perceiving her Belly rather grown bigger than leffer during the Evacuation the Phyfick had made he was immediatly affured of the truth of it: She informed him that the reason why she had concealed her great-Belly, was, the refusal four Chirurgions (to whom the confest it) made to take her in Hand. From the time the was cured the fuffered not the least inconvenience during all the remainder of her time, except a little want, because all the Money the had was given the Chirurgion for her Cure. which made her come to the Hoftel de Dieu to lie-in. where I delivered her of a Child at the full time as big fat and healthy as if the Mother never had had the least touch of that Disease in her whole Body; and which was very remar- "We milt take the Ankable, the * Burden (which shers murd for it. is

is a part very susceptable of the least impression of a Woman's corrupt Humors) was as neat, fair

and ruddy as could be imagined.

This example, which is very true, may convince us that a big-bellied Woman may be taken in hand for the Pox; and more fafely, if the Precautions noted above be carefully observed: For it is without contradiction that if this Woman had not been cured, the had this fecond time been brought to Bed of a rotten Child, as before. Relating once this Hiftory to a Chirurgion, a Friend of mine; he told me that he himself twice in two different Persons had the fame fuccess, who were very well cured, and their Children likewise well born at the full time, without having the least impression of the venom in any part of their Body. Varandem confirms to us this truth in the 2d Chapter of his 2d Book of Womens Difeafes, where he precifely tells us, that he had feen big-bellied Women, who had had this Disease eradicated by anointings with Mercuny and Salivation prescribed by Empericks; which may convince us that this Cure will easily have a better fuccess, when govern'd and manag'd by a knowing and experienced Person.

In a word, tis easy to be persuaded that they can endure it, altho with Child, because many very often have continual Feavers for 12 or 15 Days, and other acute Diftempers, for which they have been

Of Abortion, and its Conjes which

When a Woman casts forth in the beginning what she had retained by Conception in the Womb, tis called an Efficien or a fliding away of the Seeds because they have not yet acquired any folid Substance if they miscarry of a false-conception, which is ordinarily from the latter end of the first to the end of the second Month it is called an Expulsion; but when the Infant is already formed, and begins to live, if it comes before the time ordain'd and prescrib'd by Nature, it is an Abortion: which may happen from the fecond to the beginning of the feventh Month for afterwards it is accounted a Birth, because the Infant being strong enough, and having all its Reffections, may then live, which is impossible, if he comes before. These things thus understood, we then fay that an Abortion is an ishing forth of the Child yet imperfect, out of the Womb contrary to Nature, before the term limited; which is the cause, that for the most part it is dead, or if fometimes allve, it dies in a hort time after rode A dood on a si ti san

We may for the most part affect, that every acute Disease easily makes a Woman missearry; because they destroy her Fruit, which being dead, never stays long in the Womb; and also puts the Woman in great hazard of her Life, as saith Hippocrates in the 30th Aphorism of his 5th Book, Mulierem gravidam merbu quapiam acuto corripi, lethale. The particular causes of Abortion, are all the Accidents men-

mentioned in the preceding Chapters, as violent and frequent Vomitings; because there is not only want of fufficient Nourishment for Mother and Child, when the Food is fo continually vomited up. but also great reachings and endeavours by which the Womb being often compressed, and as it were shaken is at last constrained to discharge it felf be. fore its time. Pains of the Reins, great Cholicks and Gripes thay likewife cause the same Accident, as the Strangury alfo, for there are then made frong compressions of the Belly every moment to expel the Urine. Great Coughs by their frequent Agitation, fuddenly thrusting the Diaphragma with force downwards, give also violent shocks to the Womb Great Loofnelles endanger a Woman to miscarry, according to the 34th Aphorism of the 5th Book and sooner if a Tenesmus follows, which is great needings, whereby the right Gut feeks to expel the sharp Humors that irritate and provoke it. makes us take notice of the 27th of the 7th Book, Mulieri utero gerenti, si tensio supervenerit, facit abor. tum: for in this case the Womb, which is scituated upo the Redum, receives a great commotion by its continual needings. If a Womans Courses flow immoderately, it is impossible her Fruit can be in Health, as it is in the 60th Aphor. of the 5th Book; for belides, that the Infant is not fufficiently nonrished the Womb also by being too much moistened, is easily relaxed and opened. Letting Blood immoderately doth the same for the same reason, especially if the Child be great, according to the 31st Chapter of the same Book.

But one of the worst Accidents which cause ABeing very rarely eured. bortion, is that * Flooding which

which proceeds from the separation of the After-Birth from the Womb, of which we treated in

the 20th Chapter of this first Book.

he

A-

ig,

The Dropfy of the Womb hinders the Child from growing to Perfection, for the great abundance of Water extinguisheth the natural heat which is already at that time much debilitated; and the Pox in the Mother infects the Child, and often kills it in her Belly as we have demonstrated in the preceding Chapter; and whatever very much agitates and shakes the big-bellied Womans Body, is Subject to make her miscarry; as great Labour, ftrong Contorfions, or violent Motions, of what manner foever, in falling, leaping, dancing, and running or riding, going in a Coach or Waggon, crying aloud, or laughing heartily, or any blow received on the Belly; because that by such Agitations and Commotions, the Ligaments of the Womb are relaxed, yea and sometimes broken, as also the After-Birth and Membranes of the Fatus are loofned. A great Noise suddenly and unexpectedly heard. may make some Women miscarry; as the noise of a Cannon, and chiefly Thunderclaps; and yet more eafily, if to this noise be added the Fear they usually have of fuch things, which happens rather to the young than elderly Wo-

the young than elderly Women; * because their Bodies being more tender and transpirable, the Air, which is strongly forc'd by that Noise,

Women troubled with Vapours, are they that suffer by Surprizes in such a Nature.

being introduced into all her Pores, offers a great violence by its impulsion on the Womb, and on the Child within it; which the elder being more robust, thicker and closer, result with more ease. Great

I 2

watch-

watchings, caufing a diffipation of the Womans Strength, and much fasting hinders the Infant from acquiring its Perfection; fecid and stinking smells do much contribute to Abortion, and amongst others the fmell of Charcoal, as appears by the Hiflory recited in the 10th Chapter of this Book.

The Indispositions of the Womb produce the same effect, as when it is callous, or to small, or so much compressed by the Epiploon, that it cannot be extended, as it ought to be, sufficient to contain the Child and Burden with ease, together with the Waters, which may likewise happen, if the Woman be too strait laced, or keeps in her Belly with ftrong and stiff Busks for to be well shap'd; or by this fubtilty to conceal a great-Belly, as fome do; frequent Copulation, especially towards the end of her Reckoning, may effect the fame thing, because then, the Womb being very full, bears much downwards, and its inward Orifice being very near, is subjected to violence.

If a Woman miscarries without any of these Accidents, and that one defires to know the cause of it, Hippocrates explains it in his 46th Aphorism of the 5th Book, where he faith, Que vero mediocriter corpulente abortum faciunt secundo mense, aut tertio, sine occasione manifesta, iis acetabula uteri mucoru funt plena, nec pra pondere fatum continere possunt, sed abrumpuntur : any Woman indifferently corpulent, that miscarries the second or third Month, without

manifest or apparent cause, 4 I own none in Women. it is because the * Cotylidons of the Womb (which are the inward closures of its Vessels) are full of viscous Filth, by reason of which they cannot retain the weight of the Ferm,

which

119

m

lls

0-

i-

ne

Co

e

n

y

):

which is loofened from it. To this Accident phlegmatick Women are very subject, and those who have the Whites exceedingly, which by their continual Affluence, moisten, and make the Womb within so slippery that the After-burden cannot adhere to it, which also relaxeth it and its inward Orifice, that the least occasion causeth Abortion.

But if the Passions of the Body cause so much hurt to a big-bellied Woman, those of the mind do no less, and especially Choler, which agitates, inflames, disperses and troubles all the Spirits, and mass of Blood, by which the Child suffers extreamly, because of the tenderness of its Body; but above all, fudden Fear, and the relation of bad News, are capable to make a Woman miscarry at that instant; (as it happened to the Mother of that Coulin of mine, whom I mentioned in the 10th Chapter of this first Book) which likewise the other Passions may cause according as they are more or less violent, but not fo easily. There are yet other causes of miscarrying which may be said to proceed from the Infant, as when they are monstrous, because they do not then follow the rule of Nature; as likewife when they have an unnatural scituation, which makes them torment themselves because of their troublesom or uneasy apartment, and they oblige the Womb to expel them, not being able to endure the Pains they cause, which it also does, when the Fatus is fo great that it cannot contain it to the full time, nor the Mother furnish it with fufficient Nourishment.

If we find one or more of the above specified Accidents, and that the Woman withal hath a great heaviness in her Belly, so that it falls like a

Ball on her Side when the turns, and that there proceeds out of her Womb stinking and cadaverous Humors, it is a fign the will foon mifcarry of a dead Child: moreover, her Breafts will confirm it. if having been hard and full in the beginning, they become afterwards empty and flacced, as is specifi-· ed in the 37th Aphorism of the 5th Book; and the 38th of the same Book, faith, That if one of a big. bellied Womans Breafts, who hath two Children, begins to flag it is a fign the will mifearry of the Child of that fide; and of both, if both flag in the fame manner.
It is most certain, a Woman is in more danger of

her Life when the miscarries, than at her full times because (as we have said before) Abortion is wholly contrary to Nature, and very often accompanied with Flooding: and in more danger of miscarrying always, if the miscarries of

A Vulgar Errour. the * First; and some apprehend then an impossibility of ever having Children after to which young married People are very fubject, because of the violent emotion and perturbation of the whole Body, excited by ardent and frequent Copulations; but notwithstanding, they may preserve their Fruit, when their greater vigour is over, and their loves a little moderated.

We have taught in each of the foregoing Chapters, how to prevent all the Accidents before recited, any of which is sufficient to make her miscarry; and the easier if many are complicated: wherefore to avoid a troublesom and needless repetition, you may have recourse to the Remedies there taught, by which both Women and Children

may escape the danger of Death.

They that are subject to Abortion, ought above

all to take their eafe, and keep in Bed if they can, observing a good Diet, and retraining Copulation association as they believe themselves to be with Child; avoiding the use of all Diureticks and Aperitives, which are very pernicious; as also violent Passions of the Mind, because they are very prejudicial. She ought likewise to be * loose in her Dress, that she may they use themselves.

ftrait laced, and rackt, as most of them are ordinarily with their Busks under their Cloths, to make their Bodies strait; and amongst other things, they had need take heed of slipping and falling in their walking, to which big-bellied Women are very subject, because the bigness of their Bellies hinders them from seeing their way: they will therefore do well to wear low-heel'd Shoes with large Soals, to prevent hurting themselves, as too many daily do. I admire in this case the superstition of many Midwives, and some Authors, who order a Woman with Child, to take, assoon as she hath hurt her Belly with a Fall, some Crimson Silk, small minced in the Yolk of an Egg, or the Grains of the Scarlet, and Treddles of several the Kermes.

Eggs put into the Yolk of one; as if that entring the Stomach, were able to fortify the Womb and the Child in it, and to keep it there,

Of Labours Natural, and Unnatural; with the way how to help Women in the First, and the right means of remedying the rest.

and in S it is very unprofitable to those that imbark on the Sea for a long Voyage, (as for example, to the Indies, or the like) if affor the having by their Prudence escaped all the dangers incident to fo long a Voyage, they are Mipwrackt in the Haven? So likewife it is not; infficient that a great-bellied Woman should be preferved from all the Difeases mentioned in the preceding Book, for nine whole Months, if at the end of that time the be not well delivered of it by a happy Labour. This therefore shall be the whole flibject of this fecond Book, where we will treat as well of the natural as unnatural Labours, and teach the manner of aiding and comforting Women in the first, and the means to regulate all the rest. continue any longer in the Wemb; which is then

d an Expulsion I A A HO the third Month

What Labour is, and the differences of it, together, with its different terms.

By a Delivery we understand either an Emission of Extraction of the Infant, at the full time, out of the Womb. This definition may comprehend as well the Natural, which is accomplished by Emission, when the Infant coming in a commodious and

and usual Figure, the Womb lends it forth without extraordinary violence: as the Delivery contrary to Nature, which we are often engaged in,

extracting it by manual Operation.

Every time the Womb lets pass, or sends forth whatsoever it had retained and formed after conception, must not be called a Labour; for, observing what I have already noted above, and what I will here again repeat, that it may be more plain, If a Woman voids by the Womb what is contained in the beginning after she had conceived, it is properly called an Effluxion or slip because at that time, there is nothing formed or figured, neither

* There is nothing lies in the Womb after Coistion, or can be found in fo many Days, as our Author mentions but in those Tubes in the bottom of the Womb called Tuba Fallopiana, which can vey the lirrogating Aura of the Seed to she Pegs in the Testicles.

have the Seeds yet any firm confiftence, * which is the cause why it slips away so earlily with the least opening of the Womb, as often happens between the first conceiving and the seventh and eighth day only; after which, until the end of the second Month, the Woman sometimes lets which were to Moles if they

flip false-conceptions, which turn to Moles, if they continue any longer in the Womb; which is then called an Expulsion: And if after the third Month or thereabouts, the time when the Fatus is wholly formed and animated, it is sent forth before the seventh, in that case it is an Abortion, which is always the cause, either that the Insant comes dead into the World, or dies soon after. But we properly call Labour, or Delivery, every issuing forth of an Insant which happens after the end of the seventh Month to all the remaining part of the time

time afterwards; because there is then a sufficient persection, as also strength enough, to come into the * Which is very World, * and live in it as-feldom seen.

As to the general differences of Labour, we must take notice, that the one is legitimate or natural, the other illegitimate or against nature. To come to the knowledg of each, we say, that four conditions must absolutely be found in a Delivery that it may deserve to be called legitimate or natural: 1st, that it be at full time; 2dly, that it be speedy, without any considerable Accident; 3dly, that the Child be living; and 4thly, that he comes right in a good posture or scituation: for if any of these four are wanting, the Delivery is against Nature; and the more, by how much there

are more of them wanting.

As to the due time of Labour, most Authors affert that Nature hath appointed to all other Animals a certain limited time of going with young, and bringing them forth: but that Women only. by a particular favour of the same Nature, have none prefixt, neither for conceiving, going with Child, nor bringing forth. And as to Conception. 'tis most certain, that a Woman can conceive at any time Night or Day, Summer or Winter, or any other Season whatsoever; because she can copulate when she pleaseth, which few other Animals can, who couple but at certain Seafons when they become luftful: but as to the time they are accufromed to go with young, it is no more precisely determined to them, than to a Woman; for as the may be brought to Bed either in the 7th, 8th, 9th, Icth.

. I account it a Mifake in the Womans Reckoning.

Toth, yea and fometimes the * 11th Month (which happens very rarely) but for the most part in the 9th Month.

So likewise for example, tho the ordinary time for a Bitch to Puppy is the 4th Month or thereabouts, fo fome Puppy fooner and fome later: and Ewes which year their Lambs at the end of five Months, advance or recede from that ordinary term, according to the Ground where they feed. and the quality of their Pasture, to which contributes many particular dispositions of each of these Animals; which likewise happens to all others, as well as to Women. We may perceive the fame also

Analogy.

tot : noneming in + Fruits for the Seasons Here is very little and different Climats always more or less affift their speedy

Maturity, which depends likewife very much on good Husbandry. The first time that a Child may live, when born, is the 7th Month compleat, and it may better from that till the end of the ork Month, but affoon as that time is pass'd, the stay it makes after in the Womb, is no ways beneficial to it, because it hath then acquired all necessary Perfection and Strength fufficient to refift all outward Injuries. The Child born before the 7th Month cannot live long, as we faid before, because of its weakness: but he that is born in the 8th Month may very well live, yea, and more likely than born in the 7th Month (which is contrary to the opinion of all the World); because it is more perfect, as I shall demonstrate afterwards in the fifth Chapter of this fecond Book, where I will particularly shew the cause of this Error.

Now

he

he

h

ne

2-

d

76

0

Now as we fometimes fee Children born at the feven months end, do live notwithstanding; fo there are some Women not brought to Bed till towards the 10th month, and fometimes not till the beginning of the 11th: altho this may happen in fome, yet there are many who deceive themfelves in their reckoning, believing that they are gone but 7 or 8 months, and fometimes 10, or more, when they are but just 9; that which thus abuseth them, is their imagining themselves with Child precisely from the suppressing of their Courses, tho it be not always true; because some have wanted their Courses 2 months before they became with Child; and others have them, on the contrary, * 2 or 3 months longer. after, in the usual manner: which daily happens according to their different constitutions and temperaments, more or less Sanguine.

If (as we have said) the entire and perfect term be necessary to the legitimate and natural birth; a good figure and scituation of the Child is no less, which ought to come with the head first, in a strait line, having the face turned downwards, that is towards the Mothers back, the arms couched along its sides, and the thighs stretcht upwards. This sigure is much the better and convenient, because

after the head (* which is the biggest part of the Child) is passed, all the rest comes forth easily, and that being so, none of the joints of its body can be turned to hinder its pas-

* Our Author might have excepted the shoulders.

fage forth: but any other part that may first prefent its self to the Labour, makes it unfortunate, and against Nature, in which case there is often

great

great danger to Mother or Child, and some times to both, if not fuddenly and duly helped.

They who have no perfect knowledg of the parts of a Womanss Body, acquired by Anatomy, are contented to admire, & cannot (as they fay) conceive how it is possible, that an Infant so big, can pass in time of Labour through the Vagina of the Womb so small; at which Galen and many other Authors, have much admired; many of whomare of opinion that the Womans os pubis is separated to enlarge the passage at that time, without which it would be impossible for the Infant to have room enough to be born; and therefore Women a little antiquated, suffer more in their first Labours than others, because their os pubis cannot be so easily separated, which often kills their Children in the passage. Others are of the opinion, that it is the os ilium which is disjointed from the os facrum to the same purpose; and say, both the one and the other of them, that these bones thus separated at the hour of Labour, are thereto by degrees a little before disposed by the slimy humours which flow forth from about the Womb, and then mollify the cartilage, which at other times join them firmly. But these two opinions are as far from Truth as Reason; for Anatomy convinceth us clearly, that the Womb by no means toucheth these places or doth mollify them by its humours; as alfo, that these bones are so joined by the cartilage, that it is very difficult to separate them with a Knife, especially the ilium from the facrum, and almost impossible in some elderly Women, without great violence, altho Ambrose Parre (citing many Witnesses

Witnesses then present at the thing) reports the * Hiltory of a Woman, in whom (having been hanged 14 reed from ladays after the was brought to bed) boar. he found (as he faith) the os pubis

le-

Which could in no mife pro-

separated in the middle the breadth of half a finger, and the offailia themselves disjointed from the or facrum. I will not in this case accuse him of imposture, for I have too much respect for him, and esteem him too sincere for it; but I indeed believe that he was mistaken in this separation; for there is no likelihood that being fo at the time of her Labour, it would remain fo a fortnight after the breadth of half a finger; for then they should have been obliged to carry this Woman to Execution: for the would not have been able to have supported her self to climb the Ladder of the Gibbet, and to keep her felf on her legs, according to the custom of other Malefactors; because the Body is only supported by the stability of these Bones: wherefore we must rather believe, as most probable, that such a disjunction and separation was caused either by the falling of this Womans Corps from the high Gibbet to the ground after execution; or rather by fome impetuous blow on that place, received from fome hard or folid thing. If we examine well the different figure and structure of these bones between a Man and a Womans Sceleton, we shall find a larger empty space and distance between these Bones. much more considerable in Women than Men, and that to this purpose the least Women have the Bones of the Ischion more distant the one from the other, than the biggest Man : they have all likewife the os facrum more outwards, and the pubis belleti flatter,

flatter, which makes the passage from this capacity, larger, and more able to give way to the Ghild at the time of Labour; they have besides this, the Bones ilia much more turned outward, that the Womb being impregnated, may have more room to be extended on the sides, and be more at ease supported by such a disposition as is here represented.

These two Figures of Bones represent the Bones that form the whole capacity of the Hypogastrium.

A shews the Mans Bones. B the Womans, for to know the difference, that the Womans is more capacious and spacious than the Mans; for C & C, D & D, E & E, are at a larger distance, one from the other, in the Womans than they are in the Mans; and besides, that Women have the Coccyx, marked F, more turned outwards than the Men, which gives way to the Injants Head to pass without great distintly through the large passage there is between the two Bones of the Ischion, marked E & E, without any necessity for the separation of the Os publis, as some have imagined contrary to truth.

The Bladder and Rectum being emptied of the Excrements they contain, do in no wife hinder the Womb, on purpose made membranous, from dilating it felf as it doth, to let the Infant pass in Labour, by this great empty space sufficient for it, without any necessity that these Bones should be disjointed or separated: for if it should so happen, Women could not keep themselves on their legs, as many of them do, immediately after they are brought to bed; because it is instead of a support to them, as is already said, and of a middle juncture to all the rest, as well of the upper as the nether parts of the Body. I noted that very well in the Hostel

Hoffel Dien of Paris, in the many Women I have laved there. When Women, that are there to be brought to bed, begin to be in Labour, they go into a little room called the Stove, where all are delivered upon a little low bed made for that purpose, where they put them before the fire; afterwards, as foon as it is over, they conduct them to their bed, which fometimes is a good way off from this little Chamber, whither they walk very well; which they could never do, if their Os pubis, or those of the Ilia, were separated the one from the other : belides, we often fee Maids that conceal their Labour, put themfelves (the better to hide their faults) immediately to their ordinary business, as if they ailed nothing: and in all that I have delivered, I could never perceive this imagined disjunction, putting my hand on the Pubis when the Child was in the passage; but I have indeed found the Coccyx, which is joined with a loofe joint to the inferior extremity of the Os facrum, to bend outwards during Labour, in which part the Women feel sometimes much pain, because the coming forth of the Child offers great violence to it, and because its head then doth much press the Rectum against it.

Moreover, having often seen and dissected Women dead a few days after delivery, I found it very difficult to separate these bones with a strong sharp Penknise, where I could never find the least appearance of any preceding separation: And if Ancient Women have more pain with the first Children than the younger, it doth not proceed from the difficulty of the separation of these bones (which never is for the reasons above) but because the membranes of their Womb are dry, hard, and

K

callous ;

* Rather, its Vagina. callous; and particularly its internal * Orifice, which therefore cannot so easily be dilated as young Womens, being more moist.

Having sufficiently explained what is Delivery, and all its differences, we must now examine what signs usually precede, and what accompany a natural Delivery and an unnatural, which shall be the subject of the next Chapter.

CHAP. IL

The Signs that precede and accompany, as well a natural as an unnatural Delivery.

When Women with Child, chiefly of their first, perceive any extraordinary pains in their Belly, they immediately send for their Midwife, taking it for their Labour; who when she is come, ought to be well informed of the matter, and careful not to put her in Labour before there is a disposition to it; for many times both Mother

and Child lose their * lives, when it is excited before the due time.

Those pains which may be called

false, are usually caused by a Cholick proceeding from Wind, which come and go, griping the whole Belly, without any forcing downwards or into the Womb, as those do which proceed or accompany Labour: and this Cholick is distipated by warm clothes applied to the Belly, and a Clyster or two, by which true Labour-pains are rather furthered than hindered. A Woman may feel other kind of pains coming from an emotion

tion caused by the Flux of the Belly, which are cafly known by the frequent flools that follow.

The figns preceding a natural Labour few days before, are, that the Belly which before lay high, finks down, and hinders a Woman at that time from walking as eafy as the nfed; and there flows from the Womb flimy humours, appointed by natire to moiften and fmooth the pallage, that its inward Orifice may the more easily be dilated when it is necessary; which beginning to open a little at that time, fuffers that flime motory :

to flow away, which proceeds + from the hamours that strain through the thin substance of the Infants membranes, and acquires a viscous con- lad Prollage. filtence by the heat of the place.

+ Why may it not rather proceed from the Glandy es,cal-

The figns accompanying prefent Labour, (that is, shewing, that the Woman is effectively in Labour) are, great pains about the region of the Reins and Loins, which coming and reiterating by intervals, answer in the bottom of the Belly Not always with congruous throws: † The face

red and inflamed, because the Blood is much heated by the continual endeavours a Woman makes to bring forth her Child; as also, because that during these strong throws her respiration is ever intercepted, for which reason much Blood hath recourse to the Face : Her privy Parts are swell'd, because the Infant's Head (lying in the Birth) often thrults and caufeth the neighbouring parts to diffend onewards, which thence appear fwelled in this manner: She is often fubject to *Commonly the

which makes many be- bel Labour. heve, who know not the canfe of it.

K 2

that

that the Women to whom it happens, are in danger to but on the contrary it is ordinarily a fign of speedy delivery, because the good pains are then excited and redoubled every moment until the bufiness be finished. This vomiting comes from a sympathy between the Womb and Stomach by reason of the ramifications of the Nerves of the fixth pair of the Brain, which are distributed to both the one and the other, and by which it communicates the pain it feels at that time ariling from the agitation the violent and frequent motions of the Child caufeth, and the strong compression the Muscles of the lower Belly makes during the throws, for to help the issuing forth of the Child: besides, when the Birth is very near, Women are troubled with an * universal trembling, and principally of the Legs and Thighs; not with cold, as at the beginning of an Ague-fit, but with the heat of the whole Body, and the humours, which then flow from the Womb, are often discoloured with Blood, which with the figns abovementioned, is an infallible mark of the nearness of the birth, tis that the Midwives usually call Shows; and if one then puts up their finger into the neck of the Womb, they will find the inner Orifice dilated, at the opening of which the Membranes of the Infant, containing the Waters, present themfelves, and are strongly forced downwards with every pain the Woman hath; at which time one may perceive them to relift, and again press towards the finger, being by fo much the more or less hard and extended by how much the pains are stronger or weaker. These Membranes with the waters in them, when gathered (that is, when they

are advanced before the Head of the Child, which makes the Midwives callin, the gathering of the Waters) prefenting themselves at this inward Orifice, do then resemble very well to the touch of the singer, the abortive Eggs which have yet no shell, but are only covered with a simple Membrane; after this the pains redoubling continually, the Membranes are broken by the strong impulsion of the Waters, which incontinently flow away, and then the head of the Child is easily felt naked, and presented at the opening of the inward by the strong impulsion of the Child is easily felt naked, and presented at the opening of the inward by the strong impulsion of the Womb. Now all

* Orifice of the Womb: Now all thefe or the greatest part of them met rogether at what time foever of a Womans going with Childen be, whether full time or no, one may be affilted the will foon be delivered; but great care mult be taken not to haften her labour, before the necessity of it be known by these figns; for that would but torment the Woman and Child in vainland put their both in danger of their lives, as that Midwife did whom I found endeavouring to put the above-named Marthe Roler in Labour at fix months end, because of fome pains the had in her Belly and Reins, without any other accident answering them downwards a which History is at lage in the fixth Chapter of the first Book, to shew that in some cases we must make no more hafte than good speed.

Labour contrary to Nature is when the Child comes in an ill Figure and scituation; as when it presents any otherwise than the Head sirst, as also when the Waters slow away along time before it is born, because it remains dry in the Womb, and they are absolutely necessary to moisten the passage, and render it more slippery. When the After-burthen

K 3 comes

comes first, it is an accident which renders the Labour always dangerous, by reason of the great flux of Blood usually following, of which the Mother may die in few hours, and the Infant (because it receives no more nourishment) is quickly smothered in the Womb, for want of respiration, which it then needs, if it May never to little after. The Labour is also grievons when accompanied with a Feaver. or any other confiderable Diftempers which may destroythe Child in the Womb, as also when pains are small, and come flow with long intervals, and little profit by reason of which a Woman is extreamly cired but the difficulty most frequent & ordinary conies from the Infant's wrong pofture. We shall fpeakmore particularly of the figns of all thefe different Deliveries, in treating of them feverally hereafter and now come to the enquiry of force particulars, without which it is impossible to assist a Woman fafely in her natural Labour, or to help her in the unnarius bones: and therefore we will examine every thing that is in the Womb with the Infant during pregnancy, and first describe those that first offer thenselves to pass the Orifice, when the Woman is near her delivery, which are the Membranes of the Infant, and the Waters contained in them.

This Figure represents the Adembranes of the Infant, wholly separated from the Womb, in which it is contained with the Waters. These Membranes in some manner resemble a great Bladder, through which the figure of the Infant may be a little perceived: there is the wife seen on the upper part, the After burthen, marked A, on that side which is sastued to the bottom of the Womb.

CHAP. III.

Of the Membranes of the Infant, and the Waters.

* S foon as the two Seeds have been confufedly mixed and retained by Conception, the Womb immediatly after, by means of its heat, feparates this Chaos, for to make out of it the delineation and formation of all the Parts, and begins to work upon these * Seeds, which * Vid. pag. the to light they appear fimilar and uniform, vetin effect contain in them many diffimilar parts, all which it separates and diffinguisheth one from the other, inclosing the most noble, and on the * outside the most glutenous and viscous, of which first the Membranes are formed to hinder the Spirits, wherewith the spumous Seed abounds. from being then diffipated, and to ferve afterwards to contain the Infant and the Waters, in the midst of which it fwims, that they may not ftream away,

As the Membranes of the Farm are the first parts formed, so are they with the Waters the first that in time of Labour present themselves to the Passage before the Infants Head. Most Authors are so dark in the descriptions they make of these Membranes, that it is very hard to conceive them as they are, by the explication they make of them. They do not so much as agree in the number of them, some account three as well for a Child as a Beast, to wit, the Chorion, the Amnios, and the Allamoides; others account but two, because there is no Allamoides in a human Farm; but to speak properly (if it be K 4

strictly examined) what there is, (as I have often

" We must allow the Allantois in a human Færus to contain the Trine.

done there will be never found but * two, which are to joined and contiguous the one to the other, that it may be faid to be but a double one,

which may indeed be separated and divided into two. I will explain it on fuch wife, as may be best understood by those that are ignorant of it : for there are many, who think with Galen, that thefe Membranes are separated and distant the one from the other, and that the one furrounds only the Infant and the other receives the Waters, which are partly engendred from Sweat, and partly from the

dient.

I do not believe that "Urine, (as they imagine); Trine is any one Ingressio and believe further, that these Waters themselves are separated the one from the other

by these Membranes, which is quite contrary : for they are both so joined the one to the other, that they two compose as it were but the same Body and Membrane, which ferves (as we have already faid)to contain the Infant with the Waters, which are all of a Nature, and shut up in the same Membranes, as I shall make appear hereafter in speaking of their Original): it matters not to the truth, after what manner this be explained, provided it may be understood as it is.

The exterior part of this Mem-* Covering. brane, or double * Involver; or, if it be esteemed two, the first Membrane presented without, is called Chorion, from the Greek word ignifying to contain, because it immediatly contains and invirons the other, which is called Am-

nios

nion, that is a little * Lamb, because it is so small and thin. Galen in his 15th Book of the ly covers the Fatus. ule of parts, calls the Burden

ę

It

d

d

Or rather from Amis culum: quali, it fisend-

Chorion. But to render this more intelligible, we shall take this first Membrane for the Chorion, which may be again separated and divided into two, tho t effectively it be but one. Tet really two. The Chorion is a little rough

and unequal throughout the whole outlide of it, in which many small capillary Vessels may be observe edrunning quite round, as also many little Fibres by which it cleaves to every fide of the Womb: but it is a little more fmooth within, where it joins everywhere, and unifes with the Annios, in fuch a manner as that it appears (as we have already declared) but as one and the same Membrane. This Chorion covers the Placenta, and cleaves close to the forepart of it, which respects the Infant, by means of the interlacings of an infinity of Vellels : it is also principally fastned to the Womb by the whole circumference of the Placenta, in which part this Membrane is a little thicker.

The Amnios, which is the second Membrane, is three times thinner than the Chorion: and is very fmooth within, but not just so much where 'tis joined and united to the Chorion. This Membrane is fo thip, that it is quite transparent; * and hath no Vessels in it. which makes it fo thin, as cannot be imagined without feeing. This Amnios doth in t no wise touch the Placenta,

* It hath Veffels in sh receiving them from the Umbelick Vein Arte. ges.

"Tis whiter & thinker.

+The Chorion toucheth it not, the Amnios being between.

the it covers it, but it lines only all the inner part of the Chorion, which is between, and from whichin may be wholly separated, if it be done with care

The better to conceive this as it is, and after what manner these Membranes are in the Womb, confider the composition of a Foot-Ball, imagining the Leather which covers it to be the Womb of pregnant Woman, and the Bladder blown up with Wind within the Foot-Ball, to be this double Membrane of the Chorion and Amnios, in which are contained the Child and the Waters together; and even as the outlide of this Bladder toucheth every where (because it is blown up) the Leather of the Foot-Ball: fo likewife the Membranes of the Futin are joined on all fides to the Womb, except where the Burden cleaves to it, in which place it palleth above it.

As to the 3d (or rather pretended) Membrane,

" It bash no fuch Farm, Office, or Origen.

† Cartilago Enliformis,

time, no more than Woas Sheep, Cows, men, * Mares, the Affes, nor any other for ought I could ever learn after many curious Inquiries.

Sometimes Infants at their Birth, bring forth

these *Membranes upon their Head, and then 'tis said they will be fortunate; which is meerly superstitious, because it happens by the strength of their substance, so that they cannot burst by the impulse of the Waters, or the Womens throws in Labour; or because the Passage being very

II.

these Films upon many Childrens Head newly born, are essentially different from any of the two Membranes. Being shinner than the Amnios, if possible, fitting only the Head of the Infant.

because the Passage being very large, and the Infant, very little, it passeth very easy without violence: in truth in this respect they may be said to be fortunate, for having been born so easily; and the Mother also for being so speedily delivered; for in difficult Labours, Children are never born with such caps, because being tormented and pressed in the Passage, these Membranes are broken and remain still there.

Within the Infant's Membranes (disposed as I have explicated) are contained the Waters, in the middle whereof he swims, and is scituated; the original of which seems very incertain, if the different opinions of Authors upon this subject be regarded. Some will have them to be the Urine emptied out of the Bladder by the *Ouraque, because they cannot find a true and easy

way for it: and because their colour and favour much resembles the Urine contain'd in the Bladder: but it is very certain, it cannot be so as they say, because the t Urachus is not perforated.

cause the † Urachus is not perforated in the Farus, and it comes not forth of the Navel; for the place where it is fastned, is always tendinous, and

† No Urachus
in a human
Fætus.

very like a finall Lute-string, through which, it is most

most certain, nothing can pass, how subtil foever; as I have often observed, and seen Mr. Gayam ob. ferve, who is, by universal Approbation, the most exact and expert Anatomist, that bath been this long time in Paris: for whose Merit, his Majesty hath conferred that honour of choosing him before all others to make those curious Inquiries and ma ny fair Experiments, in which leveral choice and knowing Persons are continually imployed, who are of the Royal Academy. Now this natural conformation doth clearly manifest that Laurentin was abused, when he faith, that he had seen a Man, whose Oraque was not closed to void a quantity of Water by the Navel; inferring thence, that it came from the Bladder by this Orachus; and that which is contained within the Infants Membranes, is collected after the fame manner. I doubt not but he faw a Man void Water by the Navel, as he faith; but it did cettainly proceed from the capacity of the lower Belly, where he had a Dropfy, & not from the Bladder; for there is no cavity in the Urachus, as we have faid, at least none except it be against the order of Nature); upon which, in this case, we must so rely, as to affirm it ought to be foin all other subjects.

There are others, who will also have these Waters to be the Urine : but they are of an opinion that it passeth through the Yard, whose passage is always open, and not by the Vrachine which never is hallow.

For my part, as it appears to me, with more reafon, and as indeed it is these Waters are only generated out of vaporous Humidities, which transude and exhale continually out of the Infants Body, and meeting these Membranes, through which they cannot pass, because they are too thick and close, are turned

turned into Water, which is thus by little and little collected, as well during the first months of Conception, the Child not yet quick, as all the remaining part of the time after, it is : for Vapors pass forth and exhale out of all porous Bodies that are hot and moift, as is that of an Embrio. The Argument every weak, by which they maintain these Waters to proceed from the Urine, because the Waters are falt, as the Urine is; now Sweat, Tears, and other Humors, which distil and transude out of the Body, are as well falt as the Urine, of which the Infant, whilft it is in the Womb, cannot have much more than Ordeur in the Guts, because at such time it receives no Nourishment by the Mouth, and that all its fuperfluous Humors may eafily pass away by transpiration, through the substance of all the parts of its Body, which is very tender: wherefore I cannot conceive any necessity to oblige them more to empty the Urine, which is in a small quantity in the Bladder, than the Excrements which are in the Guts; which is not then done in any manner, but only after the Child is born. Bartholinus and others would however have the Infant to void Urine through its Yard, and that these Waters proceed from thence: but there is a greater probability it should come by transpiration, as I have said; for before it is yet fully shaped, and quick, there is notwithstanding found a proportionable quantity of these Waters to the bigness of his Body: which makes it manifest, that it is neither the Urine rendred by the Urachus, nor the Yard, as all the World imagine: and that which proves it . An Irrefra? more plainly, is the example of fome gatte Children born with their * Yards

not perforated, who notwithstanding have these Waters, whilst they are in their Mothers Womb.

It must be observed, that when there is more than one Child, they are never in the same Menbrane, unless their Bodies are joined and adhere together (which is rare and monstrous when it happens) but each of them have their Membranes and Waters apart and separate, in which they are

each wrapt up by themselves.

These Waters, thus collected within these Membranes, have divers very considerable uses. They serve the Infant to move it self the more easily, as it were by swimming from one side to the other, and that it may not hurt the Womb by its frequent Motions against it, which would cause great pain, and often excite to Abortion were it dry: they serve also very much to facilitate its Passage in the Birth, making the way very slippery, and by that means the Orifice of the Womb being moissened, is better widened, and yeelding when they break * just when the Child is rea-

dy to follow, or a little before : for elfe, remaining dry, it is born with greater difficulty, and the Mother also more tor-

mented by it.

John Claudius de la Corvee, Physician to the late Queen of Poland, in his Book intituled De Nutrinsone Fatus, would have these Waters to serve the Infant chiefly for Nourishment, and that it sucks them by his Mouth, and swallows them (as he imagins) whilst he continues in the Womb: but the truth of the contrary being known to the least Scholar, it would be but labour in vain to resute all the reasons he brings to prove and support his

Saying; for they destroy themselves, and do all of them correspond to the Fast-hood of their Principle. * I am of opinion that forme of those Waters do pass into the Fastus, and that by the Mouth; for the very same have been found in the Ventricle of the Child dissorted for that very end.

Having thus sufficiently explained the Membranes and Waters of the Farm, we must in order enquire after the parts, by means of which it is nourished whilst in the Womb, which shall be our following Discourse.

These three Figures represent the Placema, or After-birth, and the Umbelical Vessels of the Infant.

The first shews the shape of the Burden, to the midst of which is fastned the Navel-string, and round it may be discerned the * Mem- * Skins. branes of the Infant, which remain thus wrinkled when the Child is come forth of it.

AAA, Shews the Body or Cake of the Briden.
BBB, The Skins fastned round about it. CCC, The
Navel-string, which contains the Infants Umbelical
Vessels, and proceeding from his Navel, are inserted in
the † midst of the Burden, where they
produce an infinity of Branches. DD, † Rather on
one side.

Certain Eminencies, called Knots, found
on the String, proceeding from the dilatation of the Umbelical Vessels more in one place than in the other.

The fecond shews the Burden turned on the outside, & the Childs Belly open'd, that the distribution of the Umbelical Vessels may be then considered.

E.E., Shows the Burden on that side which cleaves to the Womb: on this side there appears no Wessels as there doth on the other; but only some simple interlinings and Small outlets, by which the Blood that transudes the Womb, may distil into this Parenthyma. FFF, The Membranes, Skin, or Skirt. H, A portion of the Amnios separated from the Chorion, marked I. G, A part of the Chorion, separated from the Amnios, marked H. III, The Navel-string in which are many knots. K, The Navel where the Vessels enter. L, The Umbelical Vein, which enters into the sissure of the Liver. M. The two Umbelical Arteries, which being conducted along the side of the Bladder, are inserted into the Iliac Arteries, and sometimes into the Hypogastricks. N, The Urachus, which from the bottom of the Bladder, couching between the two Umbelical Arteries, is fastned in the Navel, without passing forth, in which place it is not bollow in the least, and is extreamly small.

The third shews the Burden of Twins, where each Child hath his several Navel-string and Membranes apart.

den, common to both Children. PPP, The Skirt or Membranes, which wrap up the Child on this side apart. QQQ, The other Membranes which contains the other Child apart.

As to the Strings, which are double to this After-Burden, that on the right is diffected at the end, to shew that there are but three Vessels only in it.

RR, Shews a strong Membrane, in which these three Umbilical Vessels are inclosed. S. The Vein which is very big. T. T. The two Arteries, much less than the Vein.

The other String cut on the other end, where are only feen the Orifices of the Vessels.

the Placema to serve it for a Magazine, that it may always have fufficient and be there again elaborated and perfected, to render it more convenient for its nourishment; for without doubt, so groß a Blood as the Mothers cannot possibly be converted into its delicate substance, if it were not first purified in the Placenta, which is afterwards fent to it by means of the Umbilical Vein, and brought back, as we shall shew hereafter, by the Arteries, which are the Conduits of which the Navel-string is composed. We say then that the Placenta is nothing but a spongy and fleshy Mass; somewhat like the substance of the Spicen, and as it were woven and interlaced with an infinity of Veins and Arteries, which compose the greatest part of its Body, made to receive the Mother's Blood, appointed for the Infant's nourishment, which is in the Womb. This mass of spongious flesh is thus called, because it resembles in figure ? Cake; some call it the Delivery, because being come forth after the Child is born, the Woman's quite

quite delivered of the burthen of her great-belly: It is likewise called the After-burthen, because it is as a fecond labour, of which the Woman is nor

ther to call it the † Pancreas of the Womb, and appoints the same use for it, as for the Pancreas of the lower Belly, to wit; * for a rest and support to the Vessels of the Navel. which dispersets an infinite number of Branches throughout all its Substance.

There is no Placenta till. the Fætus be

laxy

Fætus.

+ This Placenta is made of the menstruous Blood of the Mother, almost formed. which flows into the Womb, by the accumulation of which is formed

this Parenchimatous mass; the shape of it is flat and round, of about the bigness of a Trencher, and two fingers breaden thick towards the middle of it, where the Umbilical Vessels are fastned : but it is thinner towards the edges of all its whole circumference. It is covered with the Chorion and Amnios on the fide next the Infant, and on the other fide it is joined and fastned to the bottom on the infide of the Womb: It is strongest fastned to the Womb (with its circumference) by means of the Chorion, as we have hinted already in the preceding Chapter, which cleaves fo close to it, by the interlacings of an infinity of Vessels, which appear STUD. very

very large in its furface, that it cannot be feparated from it without laceration of its substance.

If one considers diligently, as I have done, the Placenta on that fide which joins to the Mother, they may perceive that it is also indued with a kind of light membrane, which is fo frail and small, that it is almost imperceptible: however, it many manifeftly be differned by wiping away the Blood with which it is always coloured.

There may be again observed, that all the superficies on this fide is as it were much interlined, not unlike in some measure those of an Oxes reins 1 and there appears likewise many small out-lets, by which the Blood, that transudes through the porous substance of the Womb, distills into this

fleshy mass.

T

Altho there be two Children in the Womb, nay three, if Twins, that is to fay, begotten in the same act, Chorlons, fo many they have usually but one common Afterburthen: which

* Tis common for two three Children to have to many distinct Burthens : fo many Burshens.

hath as many Navel-strings fastned to it, as there are Children; which notwithstanding are separated one from the other by their feveral Membranes, in each of which the Children are apart with their Waters; if at least (as faid in the precedent Chapters) their Bodies be not joined and adhering one to the other; in which case the Twins of this kind have as well their Waters in common, as that they are involved in the fame membranes: but if they be Superfetations, there will be as many Burthens as Children: and as Superfetation (if there are as many as may possibly K 2

be) happeneth but very rarely, fo there are few Women that have their Burthens leparated, when they are delivered of feveral Children.

We scarce find any Creature but a Woman, that hath an After-burthen, like what we have described, and dischargeth it as useless, as soon as the Child is born; for most other Animals cast forth nothing after their young, except the Waters only and fome flime, with the membranes which furround them; and instead of this fleshy mass, those which ordinarily, as a Woman, bring forth but one young

at a time, have only some * Coryle-Proper te Ins, which are many foongious kermere Animals nels, joined inwardly to the proper only.

fubstance of their Womb, where terminates all the branches of the Umbilical Vellels of their young; which kernels, as I have often obferved in the diffecting of Sheep, are not bigger than Hemp-feed, when they are not with young; but when with young, they swell extreamly, and become of the bigness of a Man's thumb, the one bigger, the other leffer: they then refemble much the figure of a round Mushroom, not yet spread, on the wrong lide, after it be cut from its stalk; and to each of those Coryledons, or kernels, are faltned the ramifications of the Umbilical Vellels: however it is certain that the Animals which have or dinarily more than one at a time; as Bitches, Rabbits and others have no Coryledons instead of which each young hath in its Cellule a kind of particular Placenta, which the Dam eats as foon as the voids it after the hath gnawed and cut off with her teeth the Umbilical Vellel which held it.

When a big-bellied Woman hath the least indisposition dipolition of her whole habit there is almost ever some mark and impression, either, in colour or subfrance on the offer-burthen, which the voids in her labour; because, it being of a very fort hibstance, ealily imbibes the ill humors of the Body, which nied to be voided by the Womb. Its natural co-low ought to be red, and to much the fairer and better coloured, as the Woman Is in good health; is substance must be whole and equally fost,

without the least fchirrow hardness.

n

From the midit of the Burthen proceeds a string, composed of many Veilels joined toges, r, which lerve to conduct the Blood appointed for the Inamongst Authors: Tome reckon four, that is, two Veins and two Arteries; others five, adding the Owaches to them; but it is very certain that there are but three only in a humane Forus, as I have found by many diffections; to wit, one Vein and two Arteries: the Vein having lent forth into the Placenta an infinity of Branches, like to the roots of a tree, is conducted by a fingle channel all along the Itring to the Infant's Navel, which it paffeth, to be at last terminated in the midst * The Lobe. of the * Fiffure, which is in the infenor part of the Liver; and the two Arteries taking their rise out of the same Platena, from a great number of the like roots, pals along the fameltring by two conduits, piercing also the Infant's Navel, and end in its Iliac Arteries, and sometimes in the Hypogastricks. The Vein is much bigger than the Arteries; its cavity is capable to admit a writing quil into it, and those of the Arteries only a small Bodkin about half the bigness of the Vein. [As I

do remember I once Saw three Arteries and one Vein

in the Navel-string of a Twin.]

These three Vellels composing the string, are wrapt up in one Membrane thick and ftrong enough, proceeding from the Chorion, which likewife is clothed about with a production from the Amnios, and may eafily be feparated: but belides that this first serves them as a sheath, in which they are all three lodged, it separates them again one from the other by its duplications; when the vellels of the string are full of Blood, it is then usually about the higness of a finger, and ordinarily of the length of a good half Ell, and fometimes of two thirds, or three quarters. It is necessary it should be of this length, that the Infant may have liberty to move it felf in the Womb, and to go forth of it at its birth without tearing the After-burthen, to which it is fixed: There are many Nodes or inequalities, like unto knots, which only proceed from the dilatation of the Vellels, which being varicofe and fuller of blood in one place than another, caufeth these eminences. Some Midwives believe superstitionsly, or would make others believe, that the number of these pretended knots, answers the number of Children the Woman shall have afterwards, which is without reason; because Women delivered at forty years of age, and of their last Child, as we find by daily experience, have as many knots on the Navel-string, as a Woman of 20

*ALadr of my Acquaintance years, who may yet have a dozen Children *: they fay further, That

being delivered of her first Child, had not one knot on her Navil-string; the Midwife told her that therefore she would engage, it would be the last as well as the first: But the next year she had Twins. if the first knot be red, the next Child the Woman shall have, will be a Boy; if white, a Girl:
but this Proposition is as ill grounded as the other;
for these Knots appear only red, or to speak more
properly, of a dark blew, according as the Vessels
are more or less full of Blood, and especially the
Vein which gives it that colour, and is so much the
more apparent, as it is superficial in that place.

There are many Authors admit, as we have faid. the Our achies into the number of these umbilical ves fels faying that it ferves to empty the Child's Urin into its Membranes: however, experience () is it is no Veffel, and that it paffeth not forth of the Navel; but that it is only a ligament in a Child, as it is in a Man, which coming from the bottom of the Bladder, terminates at the Navel, without gaverling it, as they have hitherto miltaken it. I have opened and diffected above thirty Fatus's, in none of which did I ever find it hollow, but always very folid and tendinous, towards the place where it is fastned to the Navel; and very like, as I have already faid, to a finall Lute-string: Notwithfanding I ever found it manifestly hollow in an Ewe, which was terminated with their other Umbilical vessels, at their Coryledons; in which Animals are also two Umbilical Veins to be feen, going both near one the other to the Liver, which makes that their Navel-string consists of five Veffels; but it is not the fame in a humane Fætus, for there is but one only Umbilical Vein, and two Arteries. [Vid. pag. 165.]

To understand well how the nourishment is conveyed to the Infant by the Umbilical vessels, it is very necessary to conceive, and know in what

L 4

manner

manner the Blood circulates ! which is thus The Blood having been conveyed by the Mother's Arteries, which end at the bottom of the Womb in the Placenta, which is there faitned, makes a natural transfelion through the Umbilical vein into the Child's liver, after which it is carried into the Vana bayas and thence to the Hearty whence it is fent to all the parts by means of the Arteries, and very near a like portion in quantity, being in the That Arteries, is conducted into the Umbilicals. which are there terminated for to be carried back into the Placenta, where this Blood being again elaborated, returns to make the fame journey by the Umbilical Vein passing again to the Child's Livers and thence to the Heart, and so always fuccellively, without the least intermission. But to be able to conceive easily how the Blood circulates in the Placenta, and how by the help of that part is made a mutual transfusion from the one to the other, as well in respect of the Mother, as of the Ghild; we need but imagine it to be a common part, and depending on both their Bodies: for as, to the Mother, the circulation is there made just as in her Arm, or any other part of her whatfoever: and as to the Child, it is even the fame. FThe Placenta participates of the nourishment brought to the Womb by the Arteries, tho not by any apparent Anaftomalis. The allino

. There are no Valviles found in the Umbilical Vein tho I have curioully examined it nor are any necellary: these Valuales are very frequent in the Veins of the Arms and Legs *; be-* Oftner in the cause these parts are obliged to Tubæ Stallomake different motions, which compianæ.

preffing

Hab. H.

pressing the Vessels would trouble those of the Blood, if it were not so sultained and hindred from returning; but the Umbibed Vein bath no need of any, because the Navel-string is toose and slowing in the midst of the Waters, were it rannot be compressioned therefore the motion of the Blood cannot be there intercepted, as sometimes in the Arms and Legs, or parts where there are strong contractions.

As foon as the Child is born, thele Vellels, which are bigger in a Fatw, than they are in a Man, dry up by realon of their cavity; and that part of them which is without the Belly, falls off, and is separated close to the Navel five or fix days after; for which reason they lose their first use, and begin afterwards to degenerate into suspending Ligaments, to wat, the Vein into that of the Liver, and the two Arteries ferve to extend and fustain the Bladder by the sides where they are joined to it, the bottom of which is yet inspended by the Ourachus, which comes not through the Navel, as hath been faid, but remains fo pendant all the rest of its life. We have witherto made mention of all those things which are found with the Child in the Womb, let us no show what are the different ferenations of it in the Womb, according to the different times of Preso nancy: It is a thing of very great confedence and therefore deserves some serious considerations.

The three following Figures represent the different natural scituation of the Child in the Womb

That which is marked B, shews how it is scituated the seven first months of Pregnancy. That which is marked A, shews the same scituation on the back-side. And the third, marked C, shews in what fashion

is is scituated towards the end of a Womans reckoning, and at the time it is disposed to be born.

Explication of all the Wombs, in which are contained all the Children represented in different poflures, as well in this place, as in all the following.

AAA, shews the substance of the Womb. B, The Membrane called Chorion, which lines the Womb within. CGCC, The Membrane Amnios, which is so united and joined to the Chorion, that both of them seem to be but one single Membrane. DDDD, we all the space which is filled with Waters, in midst of which the Infant slotes and is scituated. EE, the After-birth sastned to the bottom of the Womb. FFF, the Navel-string, which sluctuates wither and thither in the Waters.

CHAP. V.

Of the several natural scituations of an Infant in the Mother's Womb, according to the different times of Pregnancy.

Hen we shall have explained the several natural scituations of an Infant, those contrary to Nature, causing for the most part all ill

Labours, will easily be conceived.

It may be considered that generally the Infants, as well Male as Female, are usually scituated in the midst of the Womb; for the sometimes a Womans great Belly is a little higher on the one side than the other, yet that is, because the globe of the Womb inclines more that way, and this scituation on the side must be understood only in respect of the Mothers Belly, and not of her Womb, in the midst

midst of which it is always placed; because there is but one only cavity in a Womans Womb, marked with a small line in its length, without having two or more separations; as is seen in those of other Animals.

There are some who would have these two imaginary Cavities to be the cause why Women sometimes bear Twins, yea and sometimes more; and that the Males rather lie on the right, and Females on the lest side; which is Hippocrases's opinion in the 48th Aphorism of his 5th Book, where he saith, Fetw Maris dextra uteri parte, Fæmina sinistra magis gestantur, but without any certain reason for it; because some Women have the Males on the lest-side, others the Females on the right; and when there are Twins, sometimes both are of the same Sex, sometimes not, and indifferently scituated on the right or the lest. This is all can be said in general of the scituation of Children in the Womb.

But in particular, when we consider the several Figures it makes, it differs according to the different times of Pregnancy; for when the Woman is young with Child, the little Fætus, called Embryo, is always found of a round Figure a little oblong, having the Spine moderately turned inwards, the Thighs folded and a little raised, to which the Legs are so joined, that the Heels touch the Buttocks, the Arms are bending, and the Hands placed upon the Knees, towards which the Head is inclining forwards, so that the Chin toucheth the Breast. It resembles, in this posture very well, one sitting to yoid his Excrements, and stooping down his Head to see what comes from him. The Spine of its

Back

wards when they are born, and that the Females are with their Face upwards, but both the one and the other are always turned downwards, with their Face towards the Return of their Mother, as is abovefaid; and when it happens otherwise, it is unnatural, for the Childs Face coming upwards will be extreamly bruised, and the Nosewholly statted, because

It may be noted that when the Child hath thus changed its first scituation, being not yet accustioned to this last, it stirs and torments it self so much sometimes, that the Woman, by reason of the pains she feels, is apt to believe her Labour is at hand: And if this circumstance be well considered, we may find it to be that first pretended endeavour which Authors imagine the Child makes to be born in the 7th Month, and not being able to accomplish it, remains so till the 9th, and that reiterating it in the 8th, if it be born, it lives not long, because it was not able to endure two such

nuisant endeavours so near together. But it is a meer abuse, for if the Child turns it felf so with the Head downwards, or rather is turned, it is but by a natural disposition of the weight of the upper parts of the Body *; and if it firs much at that time and foon afnatural Pri ter,it is not from a defire to be born, but from the inconvenience it receives from this new posture, to which it was not before accultomed, as already hath been mentioned: And it begins to turn thus fometimes from the 7th Month, rarely before but by Accident, oftenest about the 8th Month, and fometimes in the oth only, and at other times alio it doth not turn at all, as we may easily perceive in those that come in their first scituation, that is, with their Feet foremost. From whence it is easy to conjecture, and I hold it for a certain truth, that the

The Infant then is turned on this manner with his Head downwards towards the latter end of the Reckoning, to the end only that he may be the better disposed for its easier passage into the World at the time of Labour, which is not then far off: For in this posture all its Joints are easily extended in coming forth, and the Arms and Legs cannot hinder its Birth; because they cannot be bended against the inward Orifice of the Womb; and the rest of the Body, which is very supple, passeth very easily, after the Head, which is hard and big, being once quite born.

Children are the more fitrong and robust, and confequently may the more likely live, by how much the nearer they approach to the more natural and

When

When there are many Children, they ought, if the Labour be natural, to come in the fame Figure, as when there is but one: but usually by their different motions they do so incommode one the other, that most commonly one of them prefents wrong at the time of Labour yea and before which is the cause that one comes often with the Head, the other with the Feet, or in any other worse posture, and sometimes both come wrong,

However the Infant may be scituated in the Mothers Belly, or in whatfoever Fashion it be that it presents at the Birth, if it be not according to the posture above described, it is always against Nature: and the natural scituation is so necessary to a good and legitimate Delivery, that those which are against Nature, do cause for the most part bad

Labours.

When a big-bellied Woman is happily arrived hear her Haven, the ought then to take great care the fuffers not shipwrack there; which she will avoid, if the observes exactly at the end of her Reckoning the Rules which follow.

CHAP. VI.

What a Woman ought to do, when she hath gone her full time.

Am not of the opinion of most Midwives, who advise Women with Child (that they may, as they fay have the better Labour) to use more than ordinary exercise towards the end of their Reckoning, as Liebant also directs, who orders them to ride in Coaches, or trotting Horses, which is a very dan-

dangerous advice, and caufeth daily many wrong Births; for, as we faid in the precedent Chapter. 'tis about that time that ordinarily the Child turns its Head downwards, and its Heels upwards, to be born right, and the poor Women often believing they may procure an easy Labour, make it by this extraordinary exercise very unhappy, which because of the agitation and commotion of the Body. causeth the Child to take a wrong posture, or makes the Womb fo to bear down and be engaged in the cavity of the Hypog aftrium, that afterwards it hath not at due time liberty to be turned; which is often the reason, why it comes in its first posture, that is, with the Feet first, besides that Labour (which ought to be Natures work, if the Child come right) is thereby excited before the full time, and tho it were but four or five days. it hinders not as I have faid elfewhere from being as prejudicial to them, as we fee it is to the tafte, goodness, and conservation of Fruit gathered but

Wherefore I counsel a Woman (tho almost contrary to the unreasonable opinion of every one) to keep her self more quiet than ordinary, when she draws near her time, that so her Child may be able to turn it self directly right, and that she by all means avoids strait lacing, that so it may have more space to be turned into a sit posture to be born; she must then likewise observe a good Diet of Meat, of good jucy and easy digestion, rather boiled than roasted, to moisten the better, and keep the Body thereby open, rather than by Clysters, which may hasten Labour; she may about eight or ten days before Labour anoint her Privities with

Warer Warer Libby.

with Goofe, Capon or Hogs Greate or fresh Butter *: or foment those parts with fomentations which may be mollifying and loofening, and fo render those Pallages more imporh

and Hippery. This ought principally to be done by those that go with their first Child; because their Passages are more strait than others who have had Ghildren already: but they who are a little

in Years, have much more pain, and are t longer in Labour of their first Child than others who are indifferently young; because the Membranes of their Womb are harder and dryer; wherefore they cannot yeild fo well, nor the inward Orifice be fo easily dilated.

Some Authors commed bathing the better to relax those parts; but it is dangerous, lest by their too much moistness, and the emotion they cause to the whole Body, they make her come a little before her time. Many Women bleed by way of prevention, when they are or believe themselves to be at their full time; which custom I cannot approve, if it be only for prevention; but I do, in case some other necessity require it, provided they abitain

from it after the 7th Month | ; be-Without dancause the firring of the Child, cauer aftermards fed by bleeding, is fometimes fo ve-

hement, that the Womb is constrained to open, before its time to be rid of the Child. If a Woman with Child observes these Rules, she will have rea-

fon to hope for a good iffue of her Chicargions Labour: in the mean time let her Practife provide her felf of a good Midwife Prance, or an expert and handy * Chirur moted before.

gion, to attend upon her as foon, as she perceives the least pain or throw, of what kind soever; for as a small Wind, or shake, will serve turn to make ripe Fruit fall, so the least Cholick, or any other false pain, may bring forward her Labour; and surprise her unprovided of help: Let us now see what is necessary when she is effectively in Labour.

GHAP. VII.

What is to be done when the Woman first falls in Labour.

A Womans travel is only many Pains with reis A terated Throws, by which she endeavours to bring forth her Child: It is fo called, because both Mother and Child Suffer and take much pains in this Action. Most People believe that there is to other reason for the cause of this Evil, but because God hath so ordained it, and that Woman according to his Word, must bring forth with Pain, because of her Sin, according to what is written in the third Chapter of Genesis, I will greatly multiply thy Sorrow and thy Conception; in Sorrow thou shalt bring forth Children, and thy desire hall be to thy Husband - This Curfe was indeed very great, because it hath extended to all Women that have brought forth Children fince that time, and will continue to all that shall come hereafter. However we find that all Females of meer Animals fuffer as much, and are in as great danger of their lives as a Woman, when they bear their young. This persuades us, that, belides

belides this precife Will of God in respect of a Woman, there must be yet a natural reason, why it should not be otherwise, to wit. That it is impossible the Womb, being very strait in comparifon of the Childs bigness, and very fensible, because of its Membranow composition, should receive a necessary dilacation for the Child's Birth, and fuch great violence, without fuffering confiderable Pains for it. Now fince a Woman, for this cause, cannot expect to shun these Pains, she must endeavour to endure them with Patience, in the hope of being fuddenly delivered from them by a fortunate Labour.

As foon as it is known that the Woman is certainly in Labour, by the figns mentioned in the fecond Chapter of this Book, where both those preceding and those accompanying Labour are recited: of which the principal are, Pains and strong Throws in the Belly, forcing downwards towards the Womb: and dilatation of the inward Orifice, perceived by touching it with the Finger: as also the gathering of the Waters, which come before the Head of the Child, and thrusting down the Membranes which contain them through which between the Pains one may in fome manner with the Finger discover the part which presents, especially if it be the Head of the Child, by its roundness and hardness: Then must all things necessary to comfort the Woman in her Labour be got ready; and the better to help her, care must be taken, that she be not strait-laced; a pretty strong Clyster may be given her, or more than one, if there be occasion; which must be done at the beginning and before the Child be too

forwards, for afterwards it is very difficult for her to receive them, because the Gut is too much compressed: they serve to excite it to discharge it self of its Excrements, that so the Ressum being emptied, there may be more space for the dilatation of the Passage; as also to stir up the Pains to bear the better downwards, through the endeavours she makes when she is at Stool, and the while all necessary things for her Labour should be put in order, as well for the Woman, as the Child, a Midwise's Stool, or *The best way:

9

If the Woman be † Plethorick, it may be convenient tobleed her a little; Blood. for by this means, her Breast being dilingaged, and her respiration free, she will have more strength to bear down her Pains, which she may do without danger; because the Child being about that time ready to be born, hath no more need of the Mothers Blood for its Nourishment, which I have often practifed with good fuccess: besides this evacuation often hinders her having a Feaver after Delivery, in expectation of which Hour she may walk about her Chamber, if her strength permits; and to preserve her Strength, it will be convenient to give fome good Gelly Broths, new-laid Eggs, or fome Spoonfuls of burnt or brewed Wine, from time to time, or a Toast dipt in Wine, avoiding at that time folid Food. Above all the must be persuaded to hold out her Pains, bear-M 2

bearing them down as much as the can, at the instant when they take her: The Midwife must from time to time taffe the inward Orifice with her Finger to know whether the Waters are ready to break, and whether the Birth will foon after follow: The must likewise anoint all the bearing place with emolient Oils, Hogs-greafe, or fresh Butter. if the perceive that they can hardly be dilated, and all the while the must be near her Woman to observe her Gestures diligently, her complaints and pains; for by this they guels pretty well, how the Labour advanceth, without being obliged to

tafte what comes from her Body fo often.

Mr. de la Cuisse deceased, who often slept near the Woman in Labour, was fo used to it, that he never awaked till just the Child was in the Passage. and which time the Woman changeth her Moans into loud Cries, which she strongly repeats, because of the greater and more frequent Pains which she then feels: the Patient may likewise by intervals rest her self on her Bed, for to regain her Strength; but not too long, especially little, or short thick Women, for they have always worse Labours if they lie much on their Beds in their Travail; and yet much worse of their first Children, than when they are prevailed with to walk about the Chamber, supporting them under their Arms, if necessary; for by this means, the weight of the Child (the Woman being on her Legs) causeth the inward Orifice of the Womb to dilate sooner than in Bed; and her Pains to be stronger and frequenter, that her Labour be nothing near fo long.

Onalms

Qualms and Vomitings, which often happen to Women in Labour, ought not to amaze any; for on the contrary, it furthers the throws and Pains provoking downwards. We shewed the cause of this Vomiting in the second Chapter of this Book,

and the reason why it is not dangerous.

When the Waters of the Child are ready and gathered, which may be perceived through the Membranes to present themselves to the inward Orifice, of the bigness of the whole dilatation, the Midwife ought to let them break of themselves, and not as some, that impatient of the long Labour, break them; intending to hasten their oufiness, which on they contrary they retard by so doing, before the Infant be wholly in the passage; for by the too hasty breaking of these Waters, which ought to serve him to slide forth with greater facility, he remains dry, which hinders afterwards the Pains' and Throws from being so effectual to bring forth the Infant, as else they would have been; it is therefore better to let them break of themselves, and then the Midwife may easily feel the Child bare, by the part which first prefents, and fo judg certainly whether it comes right, that is with the Head, which she shall find hard, big, round, and equal; but if it be any other part, the will perceive fomething inequal, and rugged, and hard or foft, more or less ac-

cording to the part it is. Immediately after * let her hasten to deliver her Woman, if she be not already, and assist the Birth, which ordinarily happens soon after, if

0

Child be (as very often) engaged in a wrong posture in the passage, so as it is almost impossible to give it a better, without extream violence to the Woman, which is also the cause of the death of Child; and they would be so far from losing their reputation, that they would augment it, because by so doing, it would be manifest they were not ignorant of the danger both of time and place; and the Chirurgeon being called, as soon as necessity required it, could have no just cause to impute any ill consequence of the Labour to them, though it should so fall out, and their Conscience would be discharged of it: for in this case (as we have faid) both the Mother's and Child's life is at stake.

As foon then as the Waters are broke, and the Midwife finds the Child to come wrong, she must advise the Woman not to forward her Pains, lest by bearing down she engage the Child too much in the passage, and so give the Chirurgeon more pains to turn it, and must send for him as soon as may be, to deliver her as occasion requires, and according as shall be directed hereafter in this Book. It is now time, after having declared what must be done whilst the Woman is in Labour, to shew how she must be helped and comforted in a natural Delivery.

M 4

This Figure doth very well represent the Globe of the Womb, which is opened but in part, to shew in what manner the Child is brought forth in a natural Labour.

A A A, Shews the body of the Womb.

BB, A part of the Vagina, or neck of the Womb, opened just at the inward Orifice.

C.C., The inward Orifice, which surrounds the Child's Head like a Crown, wherefore it is called the Crowning, or Garland.

CHAP. VIII.

Of a natural Lubour, and the means of helping a Woman therein, when there is one or more Children.

That it be speedy, without any ill accident; That the Child be alive; And that he comes right; all which being found to be so, and after the Waters be broke of themselves, as abovesaid, let the Woman be presently placed on the Pallet-bed, provided for her to this purpose near the fire; or she may, if she likes it better, be delivered in her ordinary Bed: for all Women are not accustomed to be delivered in the same posture; some will be on their

their * Knees, as many in Country Villages; others standing upright, leaning with their Elbows on a Pillow upon a Table, or the side of a Bed; and others lying upon a Quilt in the midst of the Chamber; but the best and surest is to be delivered in their Bed, to shun the inconvenience and trouble of being carried thither afterwards; in which case it ought to be surnished rather with a Quilt than a Fea-

ther-bed, having upon it Linnen and Clothes in many folds, with other necessaries to be changed according to necessity, for to hinder the Blood, Waters, and other Filth which is voided in Labour,

from incommoding the Woman afterwards.

The Bed must be so made, that the Woman being ready to be delivered, should lie on her Back upon it, having her Body in a convenient Figure, that is, her Head and Breast a little raised, so that the be neither lying nor fitting; for in this manner the breaths best, & will have more strength to help her Pains, than if the were otherwife, or funk down Being in this posture, she must spread inher Bed. her thighs abroad, folding her legs a little towards her bottocks, somewhat raised by a small Pillow underneath, to the end that the Coccyx, or Rump, should have more liberty to retire back, and have her Feet stayed against some firm thing; besides this, let her hold some persons with her hands, that she may the better stay her self during her Pains. She being thus placed near the fide of her Bed (with her Midwife by, the better to help upon occasion) must take courage and help her Pains the best she can, bearing them down when they take her, which she may do by holding her breath, and

paiore

forcing her felf, as much as she can, just as when the goeth to stool; for by such en-*The Midwife deavours, the * Diaphrayma being ftrongly thrust downwards, doth force down the Womb and Child in it; in the mean time the Midwife must comfort her, and delire her to endure her Labour brayely, putting her in hopes of a speedy Delivery. Some would have another Woman at that time to press the superior parts of her Belly, and fo thrust gently the Child downwards; but I am not of their opinion, because such compressions will rather hurt than profit, by endangering the bruising of the Womb, which is extream fore at that time; and I have feen fome Women very ill afterwards, for having been used in this manner. But the Midwife may content her felf only (having neither Ring nor Bracelet on, and her hand anointed with Oil or fresh Butter) to dilate gently the inward orifice of the Womb, putting her fingers ends into its entry, and stretching them one from the other, when the Pains take her, thus endeavouring to forward the Child, and thrufting by little and little the fides of the Orifice, towards the hinder part of the Child's Head, anointing these parts also with fresh Butter, if it be necessary.

When the Infant's Head begins to advance into this inward Orifice, 'tis commonly faid it is crowned, because it girds and surrounds it, just as a Crown; and when it is so far that the extremity begins to appear manifestly without the Privyparts, it is then said the Child is in the Passage, and the Woman in Travail imagines (althountruly, and it may be is not so much as touched by

her)

her) that her Midwife hurts her with her fingers, finding her felf as it were foratched and pricked with plus in those parts, because of the violent diffention, and sometimes laceration, which the big-

nels of the Child's Head causeth there.

When things are in this posture, the Midwife mult feat her felf conveniently to receive the Child, which will foon come, and with her fingers ends, her Nails being close pared, endeavour to thrust (as abovefaid) this crowning of the Womb back over the Head of the Child, and as foon as it is advanced as far as the Ears, or thereabouts, the may take hold of the two fides with her two hands. that when a good Pain comes, The may quickly draw forth the Child, taking care that the Navelfiring be not then entangled about the Neck, or any other part, left thereby the After-burthen be pulled with violence, and possibly the Womb also to which it is faltned, and so cause slooding, or else break the string, whereby the Woman may come to be more difficultly delivered. It must also be observed that the head be not drawn forth strait. but shaking it a little from one side to the other, that the Shoulders may the fooner and easier take its place, immediately after it be past, which must be done without lofing any time, left the Head being past, the Child be stopt there by the bigness and largeness of the Shoulders, and be in danger of being suffocated and strangled in the passage: but as foon as the Head is born, if there be need, the may flide in her Fingers under the Arm-pits, and the rest of the Body will follow without any difficulty.

As foon as the Midwife hath in this manner drawn

drawn forth the Child, the must put it on one side, test the Blood and Waters, which follows immediately after, should incommode it, or it may be chook it, by running into its Mouth or Nofe, as it would do, if it were laid on the back; after which there remains nothing but to free her from the Afterburthen, which I will show how in the next Chapter; but before that, let her be very careful to examine, whether there be no more Children in the Womb; for it happens very often that there are two and fometimes more, which he may eafily know, by the continuance of the Pains after the Child is born, and the bigness of the Mother's Belly; belides this she may be very fure of it, if the puts her hand up the entry of the Womb, and finds there another Water gathering, and a Child in it presenting to the passage; if it be so, she must have a care not to go about to fetch the After-birth, till the Woman be delivered of all her Children, if the have never to many, because Twins never have * Agreat Error. but one Burthen *, to which

there are fallned as many strings and distinct membranes as there are Children; and if one should go to draw it forth as soon as the first is born, the rest would be in danger of their lives, because that part is very necessary to them whilst they are in the Womb, and besides it endangers a shooting. Wherefore the first string must be cut, being first tied with a thread three or four double, as we shall shew more exactly hereaster, and fasten the other end with a string to the Womans thigh, not so much for fear that the string should enter again into the Womb, as to prevent the inconvenience it may cause to the Woman by hanging between

between her Thighs; afterwards, this Child being removed, they must take care to deliver her
of the rest, observing all the same circumstances
as was to the first; which being done, it will be
then convenient to fetch the
After-birth *, as we shall * Or After-births.
shew in the following Chapter.

CHAP. IX.

How to fetch the After-burthen.

NOSt Animals, when they have brought forth IVI their Young, calt forth nothing else but fome Waters, and the Membranes which contained them; but Women have an After-birth, of which after Labour they must be delivered, as of a thing ufeless and inconvenient: Wherefore as foon as the Child is born, before they do so much as tie or cut the Navel-string, lest the Womb close, they must without losing time free the Woman from this fleshy mass, which was destined to furnish the Infant with Blood for its nourishment, whilst it was in the Womb, and which at that time is called with much reason the After-birth, because it follows the Child, and is to the Woman like another Birth; for being brought forth, the is totally delivered.

To perform this, the Midwife having taken the string, must winde it once or twice about one or two of her fingers of her left hand joined together, the better to hold it, with which she may then draw it moderately, and with the right hand

the may only take a fingle hold of it above the left near the Privities drawing likewise with that very gently, relting the while the fore-finger of the same hand extended and stretched forth along the string towards the entry of the Vagina, as may be feen in the annexed Figure; always observing for the more facility, to draw it from the fide where the Burthen cleaves least, for in so doing the rest will feparate the better; just as we fee a Card which is glewed to any thing, is better feparated from the place where it begins to part, then where it is close joined.

Above all things care must be taken, that it be not drawn forth with too muth violence, left by

* Not fit to be unskilful Persons.

breaking the string near the Burthen, as fometimes hapdertaken but by very pens, you * be obliged to put up the whole hand into the Womb, to deliver the

Woman; or that the Womb, to which this Burthen is fometimes very strongly fastned, be not drawn forth with it, as hath been done to some that I knew: As also in drawing it forth with too much violence, there may happen a very great flooding, which would be of a dangerous confequence: Wherefore for these reasons it must be carefully shaken, and gently drawn forth by little and little after the manner we have just now described; and to facilitate the better its expulsion, the Woman may blow strongly the whilst into her hands shut, just as one would into the mouth of a Bottle to know whether it be broke; or the may put her finger into her Throat, as if the would excite vomiting; or elfe strive as if she were going

d

ir

01

ge

to flool, bearing always down, and holding her Breath, as she did to bring forth her Child : All these motions and different agitations produce the fame effect, and loosen and expel the After-birth out of the Womb. When all these circumstances have been observed, if notwithstanding you meet with difficulty, you may, if need be, after that you know on which fide the After-birth is scituated. command an experienced Nurf-keeper to prefs the Belly lightly with the flat of her hand, directing it gently downwards by way of friction, above all being careful not to do it too boifteroufly. But if all this be in vain, then must the hand be directed into the Womb, to loofen it and feparate it after the manner hereafter mention in the 13th Chapter of this Book, where we show the way how to draw it forth when the string is broke.

As foon as the Woman is delivered of both Child and Burthen: it must then be considered, whether there be all, and care had that not the least part of it remain behind, not so much as the Skirts or any Clods of Blood, which ought all to be brought away with the first; for otherwise being retained, they cause great Pains: all which being done, things fit for Mother and Child in this condition, must be provided, which we will mention

in their place.

When a Woman hath two Children, she must be delivered in the same manner as if she had but one; observing only, for the reasons given in the precedent Chapter, not to fetch the Burnhen till all the Children are born; and then it may be done without danger, shaking and drawing it always gently, sometimes by one string, sometimes the other, other, and fometimes by both together, and fo by turns till all is come proceeding in it according to

er mention in the 1 arb

the directions already given.
When the Infant comes right and naturally, the Woman is brought to Bed and delivered with lintle help, observing what hath been taught in the two last Chapters, of which the meanest Midwives are capable, and oft-times for want of them, a fimple Nurs-keeper may supply the place : but when it is a wrong Labour, there is a greater myftery belongs to it, for then the skill and prudente of a Chirurgeon is for the most part requisite. Which we intend now in the remaining part of this Book to treat of

CHAP X

Of laborious and difficult Labours, and those against Nature, their Causes and Differences, together with the means to remedy them.

Or the easier and better explaining these things we fay, that there are three forts of bad La bours: to wit, the Painful or Laborious; the Difficult; and that which is altogether contrary to Nature.

The Laborious is a bad Labour, in which the Mother and Child (though it comes right) fuffer very much, and are harafled more than ordinary:

The Difficulty is not much unlike the first, but besides is accompanied with some accident which retards it, and caufeth the difficulty: but the wrong Labour, or that against Nature, is caused ötiner. hy

the bad scituation of the Child, and can never be helped but by manual Operation, or the Chirurgions Hand. In the laborious and difficult Latbours, Nature always doth the Work, being a little affifted : but in that contrary to Nature, all is endeavours are vain and uscless, and there is then no help but in an expert Chirergion, without whom the must certainly perish

The Difficulties of Labour proceed either from

Mother, Child, or both.

18

t

e

t

h

e d

From the Mother, by reason of the indisposition of her Body; or it may be from some particular part only, and chiefly the Womb: or also from fome strong Passion of the Mind, with which she

was before pollelt.

In respect of her Body, either because she may be too Young having the Passages too strait or too old of her first Child; because her parts are too dry and hard, and cannot be fo eafly dilated, as happens also to them, which are too lean : they who are either small, short, or mishapen, as crooked Women, have not a Breaft strong enough to help their Pains, and to bear them down; nor those that are weak, whether naturally or by accident and crooked Persons have sometimes the Bones of the Pallage not well shaped: they who are tender and too apprehentive of Pain; have more trouble than others, because it hinders them from doing their endeavour: and they Sometimes the Child likewife who have fmall Pains and flow, or have none at all. fearce provy to it. the Great Cholicks hinder Labour alfo, by preventing the far exceeding those of the Painsi all great and acute tuife-

follocated, if not speeddy after born, forong Passions of Mind do likewise contribute much to it as fear, Sorrow, and others of the like Nature. The Woman that miscarries hath more pain than a Woman at her full time, as also than one that is hurt, altho she be very near her time.

As to the hindrances caused by the Infant, they are, when either its Head or whole Body are too large; when the Belly is Hydropical; when it is monstrous, having two Heads, on being joined to another Child, Mole, or any other strange thing; when it is dead, or so weak, that it contributes nothing to its Birth; when it comes wrong, or when there are two or more: besides all these different difficulties of Labour, there is yet one caused by the Midwife's Ignorance, who for want of understanding her Business, instead of helping, him ders Nature in its Work.

Let us now treat of the means, by which all thefe may be prevented, and the Woman Inccoured in her bad and difficult Labour as may easily be done, if we perfectly know the causes of all these difficulties; as when it happens by the Mothers being too young and too ftrait, she must be gently treated, and the Pallages and inted with Oil, Greate, and fresh Butter, using these things a long time before the Honr of Labour, to relax and dilate them the easier, left there should happen a Rupture of any part, when the Child is borns for fometimes there happens a dilaceration to the Fundament, by which both are rent into one outwardly. If a Woman be in Years of her first Child, let her lower parts be likewife amointed to mollify the inward Orifice, and the Vagilarior Meth of the N 2

th

Womb, which being more hard and callous, do not eafily yield to the necessary differtion of Labour; which is the cause may such Women are longer in Labour than others, and why their Children (being forced against the inward Orifice of their Womb, which is, as we have faid, a little callous, and also for remaining long in the Passage) are born with great Bumps and Bruises on their Heads: Small and mishapen Women should not be put to Bed; till at least their Waters be broke; but rather kept upright and walking about the Chamber, if they have Strength, being supported under the Arms; for in that manner they will breath more freely, and mend their Pains better, than on the Bed, where they lie all on a heap, Let those that are very lean, also moisten these parts with Oils and Ointments, to make them more fmooth and flippery, that the Head of the Infant and the Womb be not fo compressed and bruifed by the hardness of the Mothers Bones, which form the Passage.

The weak Woman should be strengthned, the better to support her Pains, giving her good Jelly Broths, with a little Wine and a Tost in it, or

other good things as the cafe requires.

firing her, that she will not endure many more, but be speedily delivered; On the contrary, if her Pains be slow and small, or none at all, they must be provoked by frequent and somewhat strong Clysters, that so they may be excited by the needings at Stool, and afterwards let her walk a bout her Chamber, that the weight of the Child may also help adiaties. If the Woman Floods, or that

Of

th

hath Convultions, (which is by many too long negletted) the must be help'd by a speedy Delivery, as we have already declared, and shall repeat hereafter in its proper place. If she be costive, let her use Clysters, which likewise may dissipate a Cholick, at those times very troublesom, causing great and meless Pains, very hartful, because they seet to and again through the Belly, without bearing, down, as they should do. If she cannot make water, because the Womb bears too much on the Bladder, let her try, by lifting up her Belly a little, or else by introducing a Catheter into her Bladder, draw forth her Urin.

If the difficulty or flowness of the Labour comes from the ill Posture of the Woman, let her be placed in a better, more convenient to her Habit and Stature, observing the circumstances given in the if Chapter of this 2d Book. If the be taken with any Distemper, she must be treated for it according to its Nature, with more caution than at another time, having always regard to her prefent condition. If it proceed only from the indispositions of the Womb, either from its oblique fituation, it must be remedied as well as can be, by the placing of her Body accordingly. If it be by its vicious conformation, having the Neck too hard, and too callous, and too strait, it must be anointed with Oils and Ointments, as above directed.

If it come from a strong Cicatrice, which cannot be mollified, of a preceding Ulcer, or a Rupture of a former bad Labour so agglutinated, it must be separated with a fit Instrument, lest another Laceration happen in a new place, and leave

N 3

proach more to the are time of the other of them. And as the minible of the transport of them.

Of unnatural Labours, where Manual Operation is absolutely necessary, and what Observations the Chirurgian with make before be goeth afequence: but before we mentioned a tistuod it will be convenient to fnew what conditions are

THose Labours which absolutely require Mamual Operation are, who the Child comes wrong. Hippocrates in his Book, De Natura Puein and in that De Superfortatione, admits but of three general ways for a Child to be born, to wit, with the Head first, which is * For if any part the fole * natural Figure,

when it comes right; the fecond with the Feet; and the third with the Side or across: which two last are quite contrary to Nature. But to make it more plain, we fay, That a Child may

come wrong four feveral ge-

but the Crown, To that the Body follow not in a streight line, 'tis a wrong and difficult Birth tho the Head pre-

neral ways, which are; First, any of the foreparts of the Body. Secondly, any of the hinder-parts. Thirdly, either fide. And Fourthly, the Feet. Now just as there are four Cardinal points, to which all the rest of the thirty two Winds may be reduced on the Compais, and to one of the four more than to the other, according as they participate of more or less of that point: so likewise all the particular and different wrong Postures, that a Child may prefent, can be reduced to the above-

named

named four general ways, according as they approach more to the one than to the other of them. And as the number of the feveral wrong Births is very great, we will be contented only to treat particularly of each of the principal of them; because if one be well informed of these, they may easily remedy the rest, which are of no great confequence; but before we mention the means how, it will be convenient to shew what conditions are

* Physician or and elfe that practifeth this Art.

requifite in a * Ghirurgion, that would apply himself to this Operation, and the obfervations he ought to make before he undertakes it.

These conditions either respect his Body or his Mind; in respect of his Person, he must be health. ful, ftrong and robust; because this is the most laborious and painful of all the Operations of Chirurgery; for it will make one fometimes fweat, that he shall not have a dry Thread, the it were the coldest day in Winter, because of the great pains and difficulty he ordinarily meets with as Fabricius of Aquependeme testifies; confessing that he hath often been to weary and tyred, as that he hath been forced to leave the work for his Men to finish. He ought to be well shaped, at least to outward appearance; but above all, to have small Hands, for the easier introduction of them into the Womb when necessary; yet strong, with the Fingers long, especially the Fore-Finger, the better to reach and touch the inner Orifice: He must have no Rings on his Fingers, and his Nails well pared, when he goeth about the work, for fear of hurting the Womb: He ought to have

n.

is

e-

ly

1-

٧,

k

0

a pleasant Connrenance, and to be as neat in his Clothes as in his Person, that the poor Women who have need of him, be not affrighted at him. Some are of opinion that a Practitioner of this Art ought on the contrary to be flovenly, at least very careless, wearing a great Beard, to prevent the occasion of the Husbands Jealousy that fends for him. Truly fome believe this Policy augments their Practice, but 'tis fit they should be disabused; for fuch a Posture and Dress resembles more a Butcher than a Chirurgion, whom the Woman apprehends already too much, that he needs not. fuch a Difguise: above all, he must be sober, no Tipler, that fo he may at all times have his Wits about him; he must be discreet, modest, and fecret, never discovering to Strangers those Incommodities and Diseases of Women which come to his Knowledg; He must be sage, prudent, and judicious, to conduct him always in his Operations, with good Reason: He must be pitiful, yet not fo as to distract or hinder him from his Duty, when the case requires; as also so patient, as not to precipitate any thing, but taking time sufficient to confider what is fit to be done. He must not be angry with the poor Woman, the she exclaims against him, or the other Women during the Operation; for the Pains of the one, and the compassion of the rest, oblige them to it without other cause. He should be a good Christian, of a well regulated Conscience, and do his best endeavour to bring the Children * alive:

^{*} And therefore undertake what he can safely perform; and what he cannot; leave to others that may, for Life is not to be played with.

He must deliver poor Women grain, and treat them as tenderly and with as much humanity as the Rich, extorting nothing from them, but be content with such reasonable satisfaction, as they are willing and able to give, and not to use them like a Turk or Arab, as some do, who as soon as they have done their work, whether well or ill, will be paid without-delay, and that with so much ill manners and importunity, that they force the poor People presently to borrow the Money, when they have not enough to satisfy their Desires, and take from them to the last Penny, to satisfy their tyrannical Avarice: which proceedings are very unbecoming an honest Man.

In fine, a Chirurgion indued with all these good Qualities, must be for his accomplishment and intire perfection, very knowing and expert in his

Art, and chiefly in these Operations.

There are many who believe it an eafy matter to deliver a Woman because Women usually practile it. In effect, there is no great Mystery, when all things come right and well: But when they come wrong and contrary to Nature, it is most certain that it is the most difficult and laborious of all Chicurgical Operations, as is well known to fuch as practife it. It is very good to consider the confequences of it; for in all others, for which recourse is had to a Chirurgion, the single Life of the Patient only is under his care; but in Deliveries, there is the Mothers, and one Childs life at least, and sometimes more at stake. And it hath been often feen that one fingle fault in this Operation hath caused many disorders at one time; so that one may fay very justly touching delivering of Women

Women in wrong Labours, Hoc opus, bic labor eft. Now the Chirurgion qualified as abovefaid. is only fit for the work, (to behave himfelf as he ought) must make some Observations before he undertakes it; first, whether the Woman bath frength enough to endure the Operation, which he may guess by the Pulse, if strong or weak, unequal or intermittant: Whether her Face, and chiefly her Eyes be dejected, her Speech faint, the extream parts of her Body cold; Whether she often faints away with cold Sweats, hath Convultions with loss of Sence; in short, If every circumstance persuades that the Operation would be in vain, 'tis better to let it alone, than she should die under his Hand, and he be blamed for it, and incur the name of Butcher, as is most certain when such a misfortune happens: however if there be any hope, tho never fo little, either for Mother or Child, we are obliged in Conscience to do what Art commands, and not as some Politicians, who will rather fuffer a poor Woman to die without affistance, than undetake a doubtful Operation. Wherefore 'tis better to attempt an Operation of an incertain consequence, than to abandon the Sick to a certain Despair; * A sufficient justi-* for fometimes Nature refication for consciencovers beyond hope; but betions Practifers, afore the Chirurgion undergainst the malignant takes it, let him give his Prog-Tongues of the Igno-

of Death, both Woman and Child is in, which he must acquaint the Husband and Friends with, and the Woman her self, if he thinks that she is able to bear it, that so she may receive

rant.

nostick of the great danger

receive the Sacrament before the Operation, left the be not capable of it afterwards; because of the laboriousness of the Operation, in which the hav possibly die, as it hath sometimes happened; but when the Woman hath firength enough, the Chirurgeon must not delay his help, for fear it abate. or be totally diffinated. To which purpose, being well affured of her strength, he must enquire of the Woman, her Midwife and Friends, Whether the be at her full time, or hathreceived any hurt, which he may also perceive by the Signs, observing in what posture the Child presents, and what circumftances, Whether alive or dead; and but one or more? all which being examined, he must try to perfuade the Woman of the impossibility of her being delivered without his help; and to refolve to put her felf into his Hands, which he may do by fair words without frighting of her, persuading her that the Operation is nothing fo painful as the may imagine, and in fine that for Gods fake, her own, and the Childs, the is obliged to fuffer it, for elfe fhe and her Child may both periffi.

The Woman being thus refolved, he must place her cross the Bed, that he may operate the easier, she must lie on her Back, with her Hips raised a little higher than her Head, or at least the Body equally placed, when it is necessary to put back or turn the Infant, to give it a better posture; but if he resolves to draw it forth, he must place the Woman so as we have directed in the natural Labour, which is with her Head and Breast a sittle elevated above the rest of her Body, that she may setch her breath with more facility, and help to the exclusion of the Insant by bearing down, when the

Chirurgion bids her. Being thus scituated, she must fold her Legs so as her Heels be towards her Buttocks, and her Thighs spread, and held so by a couple of strong Persons. There must be likewise others to support her under her Arms, that her Body may not slide down, when the Child is drawn forth, for which sometimes a great strength is required; the Sheet and Blankets must cover her Thighs for decency sake, in respect of the Assistants, and also to prevent her catching cold, the Chirurgion berein governing himself as well with respect to his own convenience, the facility and surrety of

the Operation, as to the other things.

Some would have the Woman bound in this pofure, that (as they fay) she being more firm and fable, the work may be done with greater certainty: but Ligatures are fo far from that, that on the contrary they are very prejudicial; for the Woman being fo fixed, and constrained as on a Rack, the cannot raife her felf, nor flide down or be lifted up, when the Chirurgion finds occasion for it, to render his Operation less difficult, which usually he doth by partly putting back, partly drawing forth, fometimes directly, fometimes obliquely, for which reason her Body ought to be at liberty, only held in a posture convenient to these several Intentions by her Friends, according to his direction: but if the must needs be bound. letit be with good reasons to persuade her patiently to endure her Labour, and to contribute her whole strength to the Operation, promising her the speediest Delivery possible.

Let the Chirurgion then anoint the entrance of the Womb with Oil or fresh Butter, if it be necessary, ceffary, that to he may with more case introduce his Hand, which must likewise be anointed having the conditions above specified after which he must manage his Operations after the manner I shall direct in each of the following Chapters having first recited the marks by which may be known when ther Child be alive or dead out of doing and dead and a thic Spect and the state bear being

fully fatisfied, whether the Child be alive or dead; always remembring that in this case timidity is more pardonable than temerity; that is, it is better to be deceived in treating a dead Infant, as if it were alive; than a living one, as if it were dead.

The Child may be known to be alive, if it be at the full reckoning; If the Woman hath received no huft; if the hath had her health well all her going with Child; if the beat that prefent in good health, and very fure if the feels it flir, which may be known by the Mother's relation! and the Chirurgeon may be better affored of it, it he feels it ftir himself, laying his hand on the Mother's Belly; to whose relation he must not always trust, for I have fometimes delivered Women, whose Children had been dead above four days (as may easily be judged by their corruption) who not with it and ing affirmed (altho untruly) that they felt them flir but a litthe before they were delivered; and others again, who were alive, yet they never perceived them to stir in three or four days before, as they confessed. If the Chirurgeon cannot be assured by the Infant's motion that it is alive, he may, as foon as the Waters are broke, gently put up his hand into the Womb, to feel the pulfation of the Navel-string, which he will find stronger the nearer he feels it to the Infant's Belly; or if he meets with a hand, he may feel the Pulse, but their Pulsation is not so frong as the Navel-strings, by which it is best to beknown: if then he finds thus the beating of the Pulse, he may be confident the Child is alive; as alfoif by putting his finger into its Mouth, he perceives it to stir its Tongue, as if it would suck. But

But on the contrary, the Child is dead, if it hath not a long time ftirred; if there flows from the Womb ftinking and cadaverous humours; if the Woman feels great pains, and a great weight in her Belly; if it be not supported, but tumbles always on that side as she lays her felf; if she faints

* Not always a fign. the Navel-string or Secon-dine hath been a good while in the World; or if by putting his hand into the Womb, he finds the Child cold, and the Navelffring without Pulfe, and it's Tongue immoveable and feeling the Head, he finds it very foft, chiefly towards the Crown, where likewife the Bones are open, and riding the one upon the other at the Surves, because the Brains shrink, and are without Pulse when the Child is dead; which corrupts more in two days in the Womb, than it doth in four after it is born; which the heat and moiliness of the place causeth, the two principles of

But one may only conjecture it, if the Woman hath been hurt, or floods much, and be not at her full time; if her Waters broke four or five days before; if her Brests flag; if her Complexion be of a Lead colour, her Countenance languishing and

before they undertake it, that for they may avoid the abovelaid foundate wood after he bearing on the least of the least o

out, much difficulty be again dilated to have it fetched, becaused and A H Oer the hothest

flime and immidities, which untally now in the guird, alt wilder independent of the Since it is a verity indebitable, the child is born, birth remaining behind after the Child is born,

We have placed the present way of extracting the After-birth amongst unnatural Deliveries, because his not sufficient to esteem it a good Labour, that the Child be well born, unfels also the After-birth be well come away. If respect of the Child it may be called natural; because after his Birth, it hath no more need of the Burthen: but in respect of the Woman, it is very unnatural. I would therefore first treat of this bad labour; because it participates of a natural Labour in respect of the Child, who is in no danger, being born. After that I will come to those in which both Mother and Child are in very great danger, if not speedily and skilffully helped.

I have already shewed in the 9th Chapter of this Book, how a Woman must be delivered in a natural Labour, where you may find the means; but sometimes the Midwise by endeavouring it; breaks the string with pulling too strongly, or because it is very weak; or else so putrified when the Child is dead, that the least pull breaks it off close at the Burthen, which by that means is left behind in the Woman is weak and cannot expel it, being much

much tired by a long Labour or because it was not speedily after Labour drawn forth the Womb closeth fo, as leaves it no pallage, nor can it with out much difficulty be again dilated to have it fetch'd, because it remains dry, after the natural flime and humidities, which usually flow in La-

bours, are fometimes palt.

Since it is a verity indubitable, that the After. birth remaining behind after the Child is born. becomes an useless Mass, capable of destroying the Woman, we must take care that it be never left if possible. Wherefore having endeavoured to bring it away, as we have directed in the aforenamed Chapter, and the Navel-string happen to break near the Burthen, you must immediately, before the Womb closeth, introduce your hand into it, being well anointed with Oil or fresh Butter, your Nails close pared, to separate it from the Womb gently, and draw it forth together with the Clods of Blood that are there. When the Navel-string is not broken, it will easily conduct the hand by following of it to the place where the Burthen is scituated; but when it is broken, we have no longer this guide, wherefore you must be then very careful, that you be not deceived in taking one part for another; as I once faw a Midwife pull the Womb near the inward Orifice, instead of the Burthen which was behind: but when she perceived all her endayours vain, without making the poor Woman fuffer extreamly, the yielded her up to

hi-As

As foon then as you have introduced your hand into the Womb towards its Fund or bottom, you will find the Barthen; which you may know by a great number of little inequalities, which are always made there by the roots of the Umbilical vellels, on the fide where they terminate, which makes it to be easily distinguished from the Womb; if it yet cleave to it, notwithstanding that it is then a little wrinkled and uneven; because its Membranes, which were very much enlarged contract themselves immediatly after the Child and its Waters which kept them extended, are excluded : * but they * Be careful that are expert in this Art can eafily of those that judg of it. If you find the Burthen are not, wholly loofened from the Womb, it will not be difficult to draw it forth, when you have got it in your hand : But if it cleaves, find out the fide where it flicks fast, and begin there to feparate it gently, by putting some of your fingers between it and the Womb, continuing by little and little to do fo, till it be quite loofe, and afterwards draw it forth very carefully; observing always (if it cannot be otherwise) rather to leave some part of it behind, than to scrape or scratch the least part of the Womb, for fear of a Flooding Inflammation, or Gangrene, which cause death; being also careful not to draw it forth till it be wholly or the most part of it separated, for fear of drawing forth the Womb with it; and preferve it as whole as the circumstances will permit, because of shewing it to the Company, that they may know the Operation is well done,

2

When the Chirurgeon finds not the Womb open enough for to receive his hand immediately into it, let him * presently anoint, all the Woman's Privities with * Danger in Hogs-greafe, than they may be dilated with more cafe, afterwards let him by little and little put up his hand, but without much violence: the Woman may like wife contribute to this dilatation, as also to the exclution of the Burthen, if the bears strongly down, holding her Breath, and exciting her self to vomit, or Ineeze, and do those other things directed in the above-mentioned Chapter ; but if notwithstanding all this she cannot void the After-birth, and if the Womb cannot be dilated enough to fetch it, or that it cleaves so fast, as it cannot be separated, then to avoid the greater milchief we must leave it to Nature, assisting her with Remedies which suppurate; wherefore injections into the Womb are proper, made of Mallows, Marsh-mallows, Pellitory, and Linseed, in which is mixed a good quantity of Oil of Lilliers of frella Butter. This Injection fastens and tempers, and by moistning and mollifying, makes Orifice to be the easier dilated, and helps by Suppuration the loosenings of the Burthen, And to halten the expulsion of it, give her a strong Cyffer, that fo, by the motions to go to stool, it may caule the voiding of it, as it hath succeeded with many, who have rendered it in the Bed pan, and fometimes when they have leaft expected mit, because of thewing it to the C

One may at the fame time, to prevent a Fever and many other Accidents which usually happen, bleed

father imaginary Faculties,

and are fitter to cause Vomiting than comfort the Heart: but true Cordials are such as yield good nourishment, and at the same time comfort the Stomach, without nauseating it, as those Drugs do which are only good for them that sell them.

Wherefore let her have good Broths and Gellies; the may drink Limonade or Orengeade, or have in her Ptisan Syrup of Limons or Pomgranats, or from time to time (if the be weak and free from a Feaver) a little Wine and Water mixed, which we say is the best, (in some cases, but not always) and most natural of all Cordials; besides other Remedies may be provided, according to the accidents which happen, by reason of the staying behind of the Burthen, always endeavouring to bring it away as foon as possible; for as long as it flays in the Womb, the Woman feels continually great Pains, almost like to them before her Child was born, although there remained but a small piece of it, and until the whole be voided, the Pains will still be repeated, although in vain, unless the matter be well disposed before: but the leffer the piece is of the Burtheneretained, the

more difficult oftentimes it is to be expelled; be cause the impulses, which the Woman can make by helping her Throws, are not so great, when the matter contained in the Womb is small, as when it is of a considerable bigness; for then it is more strongly thrust and compressed; which is the reason why a Woman miscarries with greater difficulty, than when brought to Bed at her sult me.

There are many Midwives, who having broken the Navel-fring a

* This may ha pen to a good Midwife, but the fault is when they do not discover it, that seasonable belp may be appliced.

ken the Navel-string, as * above said, leave their work imperfect, and commit the rest to Nature's Work; but very often the poor Woman dies, because of the great mischies which happen usually before the suppuration of the Burthen so

retained: To avoid which, as soon as they meet with the like case, they must endeavour to setch it away, according as we have directed; or if they find themselves not capable of doing it, because the Hand must be put up into the Womb, which is more properly the work of a Chirurge on expert in those cases, let them presently send for one, that so he may be yet able, before the Womb closeth, to introduce his Hand; for the longer it is deferred, the more difficult will be the work.

There are other Midwives bold enough to undertake this Operation, but for want of industry, or necessary knowledg, they cannot essect it, and leave the Woman oftentimes in a worse condition

than

than if they had never medled with it; as happed about a year or little more fince to a poor Woman in the Fauxbourgh St. Marcel, whom I helped three days after the was delivered; being half gone. by a Midwife of the fame Fauxbourgh, at the delire of Mr. Beffier a Chirurgeon, and my good Friend, who conducted and accompanied me to her, where I found her in continual pain all over her Belly, which held her like Throws of another Travall, voiding black humours extreamly flinking and offensive, with which she had also a great pain in her Head, and a Feaver, which in a short time would without doubt have augmented, if I had not prefently fetched what remained : wherefore having enquired of the persons present in her Chamber, how the was delivered, and when; they fold me not yet three whole days, but that the Midwife not being able to fetch all, did only bring away fome small pieces of the Burthen, and told them, * An excuse of the Burthen, and told them, of our Midwives, but * An excuse of some

Some Authors, to prevent this inconvenience, advise that one Arm only should be drawn forth, and the other left to prevent the closing of the Womb on the Neck of the Child: this reason is plausible, yet if the Chirurgeon knows how to catch his opportunity, he will not need this shift to prevent this Accident, which may fooner happen when one Arm is left above; for besides that by isbigness it would take up so much place, which is already too little causing the Head to lean more on one side than the other, it will stop it certainly on that side where there is no Arm; and when I have sometimes tried to deliver a Woman, leaving one of the Arms above with the Head, I could not obe occasion hath been to great, that fometime

How to fetch the Head when separated from the Body, and it remains behind in the Womb.

Otwithstanding all the care possible had in the fetching a Child by the Feet, yet sometimes one meets them so putrified and corrupted, that with the least pull the Body separates from the Head, which remains alone in the Womb, and cannot be extracted but with difficulty for a sinuch as it is extreamly slippery, by reason of the place where it is, and of a round Figure, on which no hold can be taken. The difficulty usually met with upon the like occasion hath been so great, that sometimes

two or three Chirurgeons, one after the other have for aken the Operation, not being able to accomplish it, after all their industry and strength in vain employed, so that necessarily the death of the Woman ensued; but I am of opinion they had escaped this missfortune, if they had done what I shall now direct.

When then the Infant's Head, separated from is Body, remains alone behind, whether because of putrifaction or otherwise, let the Chirurgeon immediately without delay, whilst the Womb is yet open, direct up his right Hand to find the Mouth of this Head (for there is then no other hold) and having found it, let him put one or two of his Fingers into it, and his Thumb under the Chin, and then by little and little let him draw it, holding it so by the law; but if that fails, as it often will when putrified, then let him pull forth his right Hand and slide up his left, with which he must support the Head, and with the right let him take anarrow Crochet, but strong and with a single branch, which he must guide along the inside of his other Hand, keeping the point of it towards it, for fear of hurting the Womb, and having thus inroduced it, let him turn it towards the Head, for offrike it into either an Eye-hole or the hole of an Ear, or behind the Head, or else between the Sutires as he finds it most easy and convenient, and then draw forth the Head so fastened with the Crochet, still helping to conduct it with his left hand; but when he hath brought it near the Pafage, being strongly fastned to the Grochet, (as is liready directed in one of the mentioned places). et him remember to draw forth his hand, that the Passage .

Pallage being not filled with it, may be the larger and easier, keeping still a singer or two on the lide of the Head, the better to disengage it.

You may try for the same

(which appears to me very ingenious) and (thinking on this Subject) came lately into my mind, by which without doubt, one may effect this painful and laborious Operation without tormenting the Woman fo much as sheis, when either the Crochet or crooked Knife are ufed; which is a foft Fillet, or linnen flip, of the breadth of four Fingers, and the length of three quarters of an Ell or thereabouts, the taking the two ends with the left Hand, and the middle with the right, let him fo put it up with his right, as that it may be beyond the Head to embrace it, a a fling doth a stone, and afterwards drawing the fillet by the two ends together, it will easily be drawn forth, the fillet not hindering in the leaf the passage, because it takes up little or no place.

But if the Chirurgeon cannot by either of these different means draw forth the Head, because its too big, he will be necessitated (if he will finish his work) to lessen it with a crooked Knife, marked C, in the representations of the Instruments, at the end of the 2d Book. For to do this, let him slide up his lest hand into the Womb, and with his right guide up the Knife, always observing that the point be turned towards the inside of the lest hand,

* A dangerous Operation, not rashly to be undervaken.

for fear of hurting the Womb, and afterwards let him turn * it to the Suture of the Head, and chiefly

the Crown, where he must make the incision with this Instrument, that having separated some pieces, he may the easier draw forth the Head, or at least having emptied some part of the Brain, by the Orifice so made, the bigness of the Head will be much diminished by its and consequently the extraction of its less painful so

The left hand being thus in the Wolnb, will be very useful to help, striking the Knife into the Head, for to divide and feparatoits parts, as the Chirurgeon judges necessary, as also to hinder (by inadvertancy) the Womb's receiving hurt; and the right without for to hold the handle of this driftrument, which therefore must be long enough, and will ferve him to move and guide it on which fide he pleafeth, in turning, thrufting, drawing, or flanting tas the cafe requires. Ambrofe Paree and Guillemean would have this Knife to be fo short as to be hid in the right Hand, fonto do the Operation after it is fo introduced into the Wombabut it is certain, that when it is filled with a monstrous Child, or a Head, as abovefaid, the Chirurgeons hand will be to pressed in the Womb, that it will be very difficult for him to use it skilfully with one Hand alone, and do no violence to the Womb; which is the reason why (if I may be credited) this Instrument dight to have a long Handle, that being introduced into the Womboit may be conducted to do the Operation with the less and within, as we have mentioned; and governed by the right which holds the Handle of it without, which ought to be as long as the handle of an ordinary Crotchet. They that will take the pains to conceive my Arguments, and try this Instrument when they have occasion, will confess

5

c

e

t

1

y

10

confess it to be much more useful and commodious being thus long than fo fhort as the faid Paret and Guillemean recommend. For my part, having capfed one to be made of that Fashion, I found it very convenient when I had the like occasion to use it.

Now when the Head is thus fetched out of the Womb, care must be taken that not the least part of it be left behind, as also to cleanse the Woman well of her After-birth, if yet remaining. But a question of great consequence and much to the purpose may be here started, Whether the Child's Head yet remaining fo in the Womb, and the Burden allo, the Head ought to be extracted before the Burden? to which may be answered with distinction on that if the Burden be wholly separated from the fides of the Womb, it ought to be first brought a way because it may hinder the taking hold of the Head but if it be still adhering, it must not be medled with, till the Head be brought away : for if one should then go about to separate it from the Womb, it would cause a flooding, which would be augmented by the violence of the Operation ; for the Vellels to which it is joined remain for the most part open as long as the Womb is diftended, which the Head causeth whilst it is retained in it, and cannot close till this strange Body be voided, and then it doth by contracting and compressing it felf together, as I have heretofore more exactly explained: besides, the After-birth remaining thus cleaving to the Womb, during the Operation, prevents it from receiving eafily either bruife or hurt This instruction may suffice for this Chapter, let us pass to the rest, a svission of afrigue Hearthey have occallor

Fands on each dept the Head; to thrult back, by refuling the Wang A H ane Womb only

How to belp a Woman in her Labour, when the Child's Head thrusts the Neck of the Womb on forth before ito should a bird world and only in bird recents draw it by the Head, as is mentioned in the

F we only respect the figure the Child comes in In this Labour, we may fay it is natural: but when we consider the disposition of the Womb, which is in danger of coming quite forth of the Pallage, of the extraction of the Infant, we shall find it not to altogether, for its Head thrusting it forcibly before it, may easily cause a falling out of the World, if the Woman be not skilfully fuccoured in time " here may be feen the Vagina or neck of the Womb bear forth in great wrinkles according as the Child advancetti: 100

Women troubled with a bearing down of the World before they conceive, and whose Womb is very moift; are much subject to this Accident; because of the relaxation of the Eigaments. The fame Method we have taught in the natural Travail must not now be observed; for in this case the Woman must neither walk, nor stand upright; but keep her Bed, with her Body equally at least scituated, and not raised a little, as is requisite in a natural Labour: She must by no means use strong or sharp Clysters, lest they excite to great Throws, neither so much humeet the Womb, which is already too much relaxed: but to aid her at the moment each Pain takes her, when the Child begins to advance his Head, and consequently the Neck Neck of the Womb, let the Midwife keep her Hands on each fide of the Head, to thrust back. by refifting the Womans Pains, the Womb only giving way in the mean time for the Child to advance, doing the like at every Throw, continu ing it till the Woman of her felf hath forced the Child quite into the World: for one must by no means draw it by the Head, as is mentioned in the natural Labour, for fear of causing the Womb to fall out at the fame time, to which it is then very apt.

If notwithstanding the Infant having the Head born, and yet stops there fo long as to endanger its suffocation, then the Midwife must call a second Person to her assistance, to draw it gently forth by the Head, whilst she keeps back the Womb with both her Hands, to prevent its following the Infants Body so drawn forth. After the Woman is thus delivered, her After-birth must be fetch'd as is above directed, being still careful for the same reason not to shake or draw it forth too rudely, and then let it be placed up in its natural scituation, if it bears down to ho not explor out looken

CHAP. XVII.

How to fetch a Child, when coming right it cannot pass, either because it is too big, or the Passages cannot be sufficiently dilated.

Here are some Women, whose Children (notwithstanding they come right) remain sometimes four, five, and fix whole days in the Passage, and would continue there longer, if they were left alone, without being able to be born, unless affisted by Art; to which we are obliged, if we defire to fave the Mother's Life: this happens oftnest to little Women of their first Children, and chiefly if a little too much in years; because their Womb being very dry, cannot be so easily dilated, as others, who already have had Children, or are not foold. When this happens, after that the Chirurgion hath done his endeavour to relax and dilate the parts, to facilitate the Child's birth, and that he finds all in vain, because the Head is much bigger than it should be, and that besides, it is certainly dead(as it for the most part is, when it hath continued four or five days in this condition, after the Waters are broke) which he may be more exactly affured of by the figns already described in the 12th Chapter of this Book, * he need then

^{*} This may be connived at when the Child is dead: but because the most careful may ofttimes be mistaken, it cannot be approved of, as appears in the Translators Epistle to the Reader.

. 6

make no scruple to fasten a Crotchet to some part of the Childs Head, and rather about the hinder part than any other, to draw it forth by this means directly, if possible; if not, let him make an incision with a streight or little crooked Knife, which is best, about the Survey, to empty thence some of the Brains, and so lessen the bigness of this Head, and immediatly after fix his Crotchet fast to the Skull in the same place, whereby he will eafily extract the Infant.

It is very certain when the Child is dead, one ought to do according to my direction, to fave

This question is reason given in the forefaid Epiftle.

the Mothers life: but it is a very great * question, Wheout of doors, for the ther a live Child ought to be so dealt with to fave the Mothers life, after there is no more hopes that it can be

born any otherways, because of the narrowness of the Paffage, which cannot possibly be sufficiently dilated for its Birth; or whether one ought to defer the Operation, until there is a perfect affurance that 'tis dead ? In this cafe I am apt to believe, that, fince the Infant cannot avoid death neither one way nor the other, (for flaying in the Passage, without being able to be born, it must die, and being drawn forth by Crochets, it is killed) one must, and ought to fetch it out alive or dead, as foon as there is opportunity to do it, and when all hope is lost that it can come any otherways, thereby to prevent the Mothers death, which could by no other means be avoided. Tertullian (as Riolanus very well notes in his 38th Chap: of the 12th Book of his Anatomical Manual) faith upon

upon this Subject, "That it is a necessary cruelty, to kill the Child in this case, rather than to " fave it from the danger it is in of dying, and fo "certainly cause the Mother's death. Notwithflanding this must not always be put in practice by the Chirurgeon, but in fuch an extremity, and then he may do the Work as dextroully as he can. For my part I had rather do this in the like occa. fion, than refolve upon that cruelty and barbarousness of the Cafarean Section, in which 'tis abfolutely impossible (tho many Impostures, whom Rouffet favours, affure the contrary) that a Woman should ever escape, as I shall make more particularly appear hereafter, when I come to it; for by this Operation I can fave the Mother, who would perish with the Child: And as it is always better of two evils to choose the least, so we ought always to prefer the Mothers life before the * Child's.

*This Chapter might be very well spared, if every Practitioner had the Art the Translator professeth in his Epistle, of fetching a Child when it comes right, without Hooks or turning it.

CHAP. XVIII.

How to deliver a Woman when the Child presents the side of the Head to the Birth, or the Face.

Then the Child prefents the fide of the Head, tho it feems a natural Labour, because the Head comes first, yet 'tis very dangerous both to P 4 Child

Child and Mother, for he shall sooner break his Neck, than ever be born in that Fashion; and by how much the Mothers Pains continue to bear him, which is impossible unless the Head be first right placed, the more the Passages are stopt up.

* Therefore as foon as it is * A good Note, for known, the Woman must be the fome possibly, not laid with all speed, lest the unlike this Birth, may Child advancing further in in time be born, yet this vicious Posture, it prove Pris for the most part more difficult to thrust him dangerous delaying it back, which must be done because many Chil- when we would place the dren, and same Wo- Head right in the Passage, men have been so lost. as it truly and naturally Berth with self is should be districted

For to effect this, place the Woman that her Hips be a little higher than her Head and Shoulders, caufing her to lean a little upon the opposite fide to the Childs ill posture, then let the Chirurgion slide up his Hand, well anointed with Oil, by the fide of the Childs Head, to bring it right, gently with his Fingers between the Head and the Womb; but if the Head be so engaged that it cannot be easily done that way, he must then put his Hand up to its Shoulders, that fo by thrusting them back a little in the Womb, sometimes on the one fide, and fometimes the other, as he fees occasion, he may give it a natural and convenient Polition.

It were to be wished that the Chirurgion could put back the Infant by the Shoulders with both his Hands in this manner; but the Head doth then take up so much room, that he hath much ado to

intro-

introduce but one, with which he must do his Operation, with the help of the Fingers ends of the other Hand put up as far as necessary; afterwards let him excite and procure the Childs birth, as directed in the natural Labour.

At other times a Child comes with the Face first, having its Head turned back, in which Posture it is very difficult it should be born, and if it remain so long, the Face will be so black and blew, and swelled, that at first sight it will appear monstrous; which comes as well by the compression of it in that place, as by the Midwifes Fingers handling it too rudely, when she would place it in a better Posture.

I remember about fix years ago, in the like Cafe, a Woman whose Child came with the Face to black and mishapen as foon as it was born (as usually in such cases) that it look'd like a Blackmoor, however I delivered her of it alive: as foon as the Mother faw it, she told me, that she always fear'd her Child would be fo monstrous; because when the was young with Child of it, the fixed her Looks very much upon a Blackamoor belonging to the Duke de Guife, who always kept feveral of them; wherefore the wished that, or at least ared not the it died rather than to behold a Child odisfigured, as it then appeared: But the foon hanged her Mind, when I fatisfied her that this lackness was only because it came Faceling, and hat affuredly in three or four days it would wear way: as it hapned, having often anointed it with Oil of fweet Almonds by expression; and when I faw the Child about a Year after, me hought I had not feen a fairer. Now to deliver this

this Birth, the same manner, as when a Child comes with the side of the Head, must be observed, being careful to work gently, to avoid as much a may be the bruising of the Face.

CHAP. XIX.

How to deliver a Woman when the Head of the Ghild is born, and the Womb closeth about the Neck.

THe Child comes naturally with the Head first because that by the hardness and bigness of it, the Passage might be the better made and opened for the other parts of the Body, which usually pass afterwards without pain : but notwithstand ing fometimes the Head is fo fmall, and the Shoulders fo large, that without a very great difficulty, they cannot pass; which makes the Child remain often in the Pallage after the Head is born. This Accident may likewise happen sometimes, having not been careful, but losing time in drawing forth the Child by the Head, as directed in the Discourse of natural Labours, to the end the Shoulders might at the same instant succeed in the place the Head possest. beishaureds as it then ap

When the Chirurgion meets with this case, he all must speedily deliver the Child out of this Print son, or rather this Collar in which he is caught: ren for a small delay may there strangle the Child: deat to avoid which, let him endeavour to cause the Shoulders to follow, by gently drawing its Head, de sometimes by the sides of it, sometimes with one in which the case of the content of the content of the content of the content of the content of the case of the content of the content of the content of the content of the case of the content of the case

hand

П

in

hand under the Chin, the other behind the Head; and fo doing by turns on the one fide and the other, to facilitate the Operation the better, beng very careful the Navel-string be not entangled bout the Neck; as also not to draw it forth with oo much violence, for fear left it may happen, as I once faw the Head pulled from the Shoulders. If he Shoulders pass not with gentle pulling, flide pyour Fingers on both fides under the Arm-pitsl with which turning them inwards, you may by ittle and little draw forth the Shoulders; but when they are in the Passage and totally disingaged, f he cannot then draw the rest forth, still keeping is Fingers under the Arm-pits, he may be confitent there is some other hindrance, and that it is ertainly monstrous in some part of its Body; or, it for the most part happens in this case, that it s Hydropical in the Belly, for which cause it is impossible it should be born, before the Belly be pierced to evacuate the Waters, and then 'twill afily be accomplished, as I have done in the like afe, of which I will give you the particulars, and now we behaved our felves; for we were two Chirurgions, one Midwife, and a Deputy belonging to the l'Hostel de Dien to do the work.

pulling the Head (fo as the Vertebra's of the Ned were feparated, and that it hung only by a little of the Skin) I came in the interim, at which time they defired me to examine the bufines, and to find the cause why the Child could not be drawn form with all their Strength, which was sufficient to have drawn forth the Shoulders, if they had been a big again as they were; which having confidered I immediatly conceived the difficulty to proceed from fomething else: wherefore I put my Hand into the Womb up to the Childs Shoulders, which feemed not too big to pass with ease, therefore concluded that the hindrance was not there. After that I put my Hand further up, directing ital along his Breaft, at the bottom of which, near the grifle Ziphoide, I found his Belly hydropical and full of Water, fo that it was impossible ever to deliver the Woman, until the Water was emptied by piercing the Belly: but there wanting a fit la strument for the purpose, I immediatly sent to advertise one of the Chirurgions of the fame Hol pital, to whom I declared the case as I found it adding withal that the Child could not be born unless an Orifice was made to empty the Belly:but he would by no means follow my opinion, whether it was out of Policy, believing it may be, that he very well understood his business without needing my advice, or that he would not or could not be lieve the Child to be hydropical, as I informed him; wherefore he contented himfelf, without an exact examination of the case, to endeavour only the extraction of it after his manaer; and, to effeet it, he immediatly pulled and separated the Head wholly from the Body, which hung then but

by a Skin; because the Midwives, as I said before, had pulled it with so much violence. Afterwards with his Crotchets he pull'd away both the Arms, and some of the Ribs, part of the Lungs and the Heart, one piece after another for above three quarters of an hour, that he was very wet with Sweat, altho it were cold weather; and having thus tired both his Mind and Body, he was constrained to quit the work, to rest a while, leaving the Midwise to endeavour what she could the whilst, who wearied her self also in vain, as well as he had done, by pulling some of the Childs Ribs with her Hands only

(* for it is not a Midwife's work to use Crotchets.) After this he returns the second time with all his strength to the work, without effecting any more, because he had not yet opened the lower Belly, nor the Diaphragma, nor

would not, as I advised him

CHAP. XX.

How to help a Woman when the Child comes with one or both Hands together with the Head.

Por the most part when an Infant presents any part of his Body together with the Head, it is usually one or both the Hands rather than any other, which hinders its Birth; because the Hands take up part of the Passage, and for the most part they cause the Head to lean on one side. When the Child comes thus, it is quite contrary to Nature.

To remedy this, as foon as 'tis perceived that one Hand presents together with the Head, it must be prevented from coming down more, or ingaging further in the Passage; wherefore the Chirurgion having placed the Woman on the Bed, with her Head a little lower than her Hips, must put and guide back the Infants Hand with his own as much as may be; or both of them, if they both come down to give way to the Child's Head; which having done, if the Child's Head be on one side, it must be brought into its natural Posture in the middle of the Passage, that it may come in a strait, ine, proceeding further as I have directed before in the 18th Chapter of this Book, which treats of the Child's Head coming on one side.

b

t

there that they form to be all of one and the fame shape: but when the Womb is open enough to introduce the Hand into it, he will easily know which are the Hands, and which the Feet; and having well taken notice of it, let him slide he Hand, and presently direct it towards the infant's Breast, which he will find

* Unnecessary. very nearly and by that the Body to

wards the bottom of the Womb, leaving the Feet in the same place where her found them having therefore placed the Woman in a convenient Posture, that is, her Hips a little raised above her Breast and Head, which fortuntion ought always to be observed when the Child is to be put back into the Womb, let him afterward take hold of him by the Feet, and draw thim forth according to the way before directed in its proper Chapter.

This Labour truly is a little trouble some, but nothing near so much as that we have mentioned in the preceding Chapter, where, the Child presents only his Hands: for in that the Feet must be searched a great way off, and it must be quite turned about, before it can be drawn forth; but in this, they are ready, presenting the delives, and there is not much to ido, but to lift and thank a common non-much to ido, but to lift and thank a common non-much to ido.

d,

and foonest done, to draw it and aniw arms forth by the Feet; fearthing for them, if they do not present themselves, rather than to try to put it into a natural Posture, and place the Head foremost: for the great endeavours often necessary to be used in turning the Infant in the Womb (which is a little harder than to turn a Pancake in a Frying pan) doth fo weaken both Mother and Child, that there remains not afterwards frength enough for to commit the Operation to the Work of Nature, and usually the Woman hath no more Throws nor Pains fit for Labour, after she hath been so wrought upon; for which canfe it would be very tedious and difficult, as also the Infant, which is already very weak, would certainly perish in the Passage, without being able to be born. Wherefore it is much better in these cases immediately to fetch it by the Feet, fearchfearching for them, as I have already directed, when they do not prefent themselves, by which a tedious Labour will be prevented to the Mother, and the Child will be often brought alive, who without it will fearce escape death before he can be brought forth by the Brength of Nature.

CHAP. XXIII.

How to deliver a Woman when the Child

When an Infant (not being turned towards the latter months, as he ought, to come with his Head foremost, as is mentioned in the Fifth Chapter of this Book) presents the Knees to the Birth, having the Legs folded towards the Buttocks, one may easily be deceived touching but one of them, because of their hardness and roundness, and take it for the Head, especially when being scituated a little high, it can be reached but with the end of a Finger only, but if it be touched and handled a little better, the Infant being fallen a little lower, it will easily be distinguished.

As foon then as it is perceived, it must not be suffered to advance further in this Posture; but having placed the Woman, the Knees must gently be put back, to have the more liberty to unfold the Legs one after the other, which the Chirurgeon may do, by putting one or two of his Fingers under the Ham, directing them by little and little

1

all along behind the Leg, until he meets the Foot; and drawing always a little obliquely, to come the easier to the end of it, that so having disengaged one, he may do the same to the other, proceeding in the same manner as with the first; after which having brought them together, he may finish the work, as when a Child comes Footling; always observing to bring the Face of it downward, and such circumstances as are noted where we treat of that Labour.

CHAP. XXIV.

Of a Delivery when the Child comes with Shoulder, Back, or Breast.

The most difficult of these three sorts of Figures and Scituations, in which Infants sometimes come, is that of the Shoulders; because it is surthest from the Feet of the Infant, and the Chirurgeon must find them to draw it forth. The next is the Back: and the Breech, for the same reason, causeth least trouble, not only because the Feet are nearer, but also because by this Figure the Head and Neck of the Infant is not so constrained and lockt, as in the other scituations.

For to remedy this Birth of the Shoulder, some advise that it should be put back, to make way for the Head of the Infant, that so it may be reduced to a natural Birth: but it is much better, for the reasons above alledged in Chap. 22. of this Book, to try to bring it by the Feet: to effect which, the Chirurgeon must thrust the Shoulder a little

Q4

back with his Hand, that fo he may have more liberty to introduce it into the Womb, and sliding it then along the Child's Body, either by the Belly or lide, as he finds it easiest, he shall fetch the Feet, and turning it, bring them to the Passage, and so deliver the Woman, as is already directed.

If it be the Back which prefents to the Birth, it is also impossible to be born in that Posture, what Pains soever the Mother endures; and besides the Child having the Body folded inwards and almost double, his Breast and Belly are so prest together, that he usually wants little of being suffocated: to avoid which, the Chirurgeon must quickly slide up his Hand along the Back towards the inferior parts, until he meets the Feet, to bring it forth the same

way as if it came Footling.

But when the Child comes with the Breech, if it be fmall, and the Mother big, having the Pallages very large he may fometimes with a little helphe born fo; for the he comes double, yet the Thighs being folded towards the Belly, which is foft and gives way, it palleth without much trouble. foon as the Chirurgeon finds the Child to come with the Buttocks foremost, he must not permit it toengage lower in the Pallage; for it will not come lo, unless it be very small, and the Pallage very large, as we have already laid. This being then in good time perceived, he must, if he can, thrust back the Breech, and fliding up his Hand along the Thighs to the Legs and Feet of the Child, he must bring them gently one after the other forth of the Womb by folding, firetching, wagging, and drawing them gently towards the fide, being careful not to winde them too much, or cause a dislocation; and then let him draw forth the rest of the Body, as if it came with the Feet foremost.

I have faid that the Chirurgeon, perceiving the Child to come with the Breech foremost, ought to put it back if he can; for fometimes he will be advanced fo forward in the Pallage, that you may fooner destroy both Mother and Child, than reduce it back, when once strongly engaged: When this happens, he cannot hinder it from coming in this Posture, in which his Belly is so pressed, that by his Fundament. However * Child's or dure. he often voids the * meconium he may much help this Birth, by fliding up one or two fingers of each hand on each fide of the Buttocks, to introduce them into the Groins, and having crooked them inward, he must draw the Breech just out to the Thighs, and then by drawing and wagging it from fide to fide he will difer gage them from the Paffage, as also the Feet and Legs one after the other, being careful of diffocating any part, and then he may extract the rest as before, when coming with the Feet. The first

Woman I ever laid, was of a Child which I drew + thus + This way ought to forth with the Buttocks fore be avoided if possible.

because as soon as ever the Waters broke (which happed before I could arrive to hinder it) they were so forward, that it was impossible to do it otherwise, which I performed very well, and in short time, without prejudice to the Mother or Child, doing as I have directed.

as if it came with the Feet foremolf. ent mairie C. H. A. P. XXV.

Of those Births, wherein the Infant present

He Back-bone may eafily be bent and turned forwards a little, but by no means backwards without excellive violence. Wherefore the worst and most dangerous Figure that a Child can offer in the Womb to the Birth, is the Belly or the Breast; for then its Body is constrained to bend backwards and whatever Throws or Endeayours the Woman makes to bring it forth, it will never be accomplished, for the will fooner perish with her Child, than ever advance it in this Posture into the Pallage, wherefore it is in great denger, if not timely fuccoured. And in cale it should escape, which would be very strange, it would be a long while after its birth weak in the But that which augments the danger much more, is, that for the most part the Navel-String comes forth when the Child comes with the Belly. Therefore as foon as it is discovered to be fo, the Chirurgeon must apply the sole remedy of drawing it forth by the Feet as speedily as may be, in the following manner.

Having placed the Woman, let him gently flide up his flat Hand (being well anointed for the eafier entrance) towards the middle of the Child's Breast, which he must thrust back to turn it; this frituation being already half altered, the Feet being as near to the Passage as the Head, when

en

ha

presents the middle of the Belly; then he must ip up his Hand under the Belly till he finds the eet, which he must bring to the Passage, to draw forth in the same manner as if it had come ootling, being careful to keep the Breast and ace downwards, which must always be observed efore the Head can be drawn forth, for the reaons often already given, which must never be

orgotten.

When a Child comes with Breast or Belly, the hirurgeon must always proceed after the same namer in both mafmuch as they require the fame reumstances. An Infant may likewife come with the Side, which way it is as impossible to as sithe two former: but it is not so much torented, nor is the scituation so cruel; for it may emain in it a longer time without dying, than in he two former, wherein it is much more racked han in this, in which the Body may be bended brward, and not backward, as in the other; neiher doth the Navel-String come forth so easy, as then it comes with the Belly first. In this, as in he other two Births, the Chirurgeon must draw he Child forth by the Feet on this fashion: Haing placed the Woman as the ought to be, he may with back a little with his hand the Infant's Body, he better to introduce it, which he may flide aong the Thighs, till he finds the Legs and Feet, which he must turn it, and afterwards draw forth, just in the same manner as before, with he fame observations. Nor ought he to amuse unfelf in any of these three Births, to place the lead right, that it might come naturally; because tis in great danger of dying in these unnatural Pol250 Of natural, and Lib.II.
Politions, if not drawn forth with speed; which can never be effected, unless it be by finding the Feet, as I have directed. guird flum and daidw per

forth in the faire manner as if it had come GHAP. MXXVI. ad . valled

redownwards, which mult always be Of Labours mberein feveral Children present together in the different Postures above named. When a Child comes with Breaff

IF all the unnatural Figures and Scituations which we have hitherto described, that a single Child may come in, do cause those many difficulties and dangers mentioned; furely the Labour wherein feveral together come in these bad Scituations must be much more painful, not only to the Mother and Children, but to the Chirurgeon also; for they are then so constrained and pressed, that for the most part they trouble each other, and hisder both their births: belides, the Womb is then fo filled with them, that the Chirurgeon can scarce introduce his Hand without much violence, which he must do, if they are to be turned or thrust back to give them a better polition than wherein they present themselves.

When a Woman hath two Children, they do not ordinarily both present to the Birth together; but the one is often more forward than the other, which is the cause why but one is felt, and that fometimes 'tis not discovered that the Woman will have Twins, till going to fetch the Afrerbirth, the first being born, the second is then perceived has When there are Twins, one must not think that try

Nature is orderly in cauting one to be born before the other, the first or last, according as it may be melt convenient! that is to fay, When one is frong and the other weak, the ftrongest comes first; as affor when one is dead and the other living the living drives forth the dead : For it is apparent that there is no certain rule; of which

Sometime fince I delivered two Women within a week one of the other, both of Twins, one of each being dead, and the other living the living child of the first Woman was born before the deads and the dead of the fecond was expelled before the living. And the fame thing happens every day in respect of Arrong and weak Children : for that which is nearest the Birth, whether alive or dead, ftrong or weak, is always first born, or must be brought first, if it cannot come of it felf; otherwise the difficulty of the Labour would yet ther as the violence done to the first Child, in putsing it back, for to fetch the fecond first.

"In Chap. 8. we fliewed, speaking of natural Labours, how a Woman should be delivered of Twins, coming both right: It now remains to direct what ought to be done, when they come either both wrong, or one of them only, as it is for the most part the first coming right, the fecond Pootling, of any other worle Posture: and then must the Birthos the first be halt ned as much a may be that to there may be presently way for the science (which hath suffered much by this un-istural Polition) to fetch it by the Feet, without trying to place it right, altho it were formewhat VodA inclined

inclined

inclined to it; be sufe it bath been already forting and weakned, as also the Woman by the Birth of the first, that there would be more danger, the it would sooner die, than come of it self.

Sometimes when the first is born naturally, the fecond offers the Head likewife to the Birth this cafe, 'tis good committing a work fo well be gun, to Nature to finish, provided the be not to flow; for a Child may die altho right, by lying too long in the Birth; and the Woman, who had been much tormented with bearing the first is usually so tired and discouraged, when the think that bot half her work is over that the hathm more Pains, or very few and flow, nor any conf derable Throws to bear the Second as the he done the First Wherefore if the birth of the Se cond proves tedious and the Woman grows weak er, let the Chirurgeon defer it no longer, but di rect his Hand gently into the Adamin, to find the Foot, and so draw forth the fecond Child , which will easily be effected, because there is way made fufficient by the birth of the first : and if the rond Waters be not broke as it often happen, ye intending to feech it Footlings by s word semons need not scruple to break * the * Skins or skins Membranes with his Fingers, altique Jud w floid

the elsewhere we have forbidden it; but that must be understood with distinction; for when a Labour is left to Nature's work, they must break of themselves; but when a Child shall be extracted by Art, there is no danger in breaking them; may contrarily they must be broke; that the Child must be the case turned, which case would be almost impossible.

Above

B

W

vi

pa

mo

rec

but

Above all, the Chirurgeon must be careful not to be deceived, when both Children together offer to the Birth either their Hands or Feet, and must well confider in the Operation, whether they be not joined together, or any other ways monstrous; as also which part belongs to one Child, and which to the other, that so they may be fetcht one after the other, and not both together, as would be if it were not duly confidered, taking the right Foot of the one, and the left of the other. and fo drawing them together, as if they belonged both to one Body, because there is a left and a right, by which means it would be impossible ever to deliver them: but it may easily be prevented, if having found two or three Feet of leveral Children presenting together in the Passage, and taking aside two of the forwardest, a right and a left, and fliding his Hand along the Legs and Thighs up to the Twist, if forwards; or to the Buttocks, if backwards, he finds they both belong to one Body; and being certain of it, he may then begin to draw forth the nearest, without regard which is strongest or weakest, bigger or less, living or dead, having first put a little aside that part of the other Child which offers, to have the more way, and so dispatch the first whatever it is, as foon as may be; observing the same Rules, as f there were but one, that is, keeping the Breast and Face downwards, with every circumstance ditected where the Child comes Footling, and not etch the Burthen, till the second Child be born; because there is commonly * To that I have out * one for both, which if Spoken before. t were loofened from the

CHAP. XXVII.

Of a Labour when the Navel-string comes first.

A N Infant doth not always present with the A Belly when the Navel-string comes first: for tho he presents naturally as to the Figure of his Body, that is with the Head first, yet sometimes the Navel-string falls down and comes before it; for which cause the Child is in much danger of death, at least if the Labour be not very quick, because the Blood (that ought to pass and repass through those Vessels which compose it, to nourish and enliven the Child, whilst he continues in the Womb) being coagulated, hinders the circulation which ought to be there made; which happens as well by the contusion; as the cold those Vessels receive, being much pressed in the Passage, when it comes together with the Head or any other part, as also because the Blood doth there coagulate (as is faid) by reason of the cold which it takes by the coming forth of the Navel-string.

But tho this accident may cause the Infant's suddain death, it is not so much for want of nouishment, without which he might pass a day or nore, there being blood enough in his Body for hat purpose: but because the Blood can be no onger vivisied and renewed by Circulation, as it was causeth the creatures sudden death, sooner or ater, according as it is more or less obstructed.

I know it may be objected, that the the Circulation be so hindered and intercepted by the coming forth of the String, it need not therefore cause such a suddain death to the Child, because the Blood may notwithstanding circulate in all the other parts of the Body: to which I answer, that in respect to the Infant, 'tis either absolutely necessary that the Blood, for want of respiration,

* The Burthen. red in the * Placenta, and there fore there must be a free com-

munication; or for want of it, that the Infant must immediately breath by the Mouth, as well to be refreshed, as to drive forth by exspiration the fuliginous Vapours, which not being possible whilst in the Womb, it must unavoidably be choaked and die in a very small time, if it wants both together. Wherefore in this case the Woman must without any delay be delivered; which is Nature doth not speedily perform, the Child must be drawn forth by the Feet.

Women that have great Waters, and a long string to the Burden, are very subject to this mischief; for the Waters coming forth in great abundance at the breaking of the Membranes, do often at that instant draw the string which swims in the midst forth along with them; and much the easier if the Infant's Head be not advanced very forward into the Passage, to hinder the coming forth of it

in this manner.

As foon as 'tis perceived, you must immediatly endeavour to put it back, to prevent the cooling of it, behind the Child's Head, lest it be bruised as we have already noted, whereby the Blood may coa-

gulate

tl

W

tl

u

b

m

in

gulate there; keeping it in that place where it was thrust back, until the Head being fully come down into the Passage, may hinder the coming down of it again: which may be effected by holding it up with the Fingers of one hand on that fides it comes down, until the Head be advanced as abovefaid or in case the Hand be taken away, to put a piece of fine foft Rag between that side of the Head and the Womb, to stop up the way it came down by, always leaving an end of the Rag without the Body, for to draw it forth by at pleasure.

But sometimes, notwithstanding all these cautions, and the putting back of it, it will yet come forth every Pain; then without further delays, the Chirurgeon must bring the Child forth by the feet, which he must search for, tho the Infant comes with the Head; for there is but this only means to fave the Child's Life; which it would certainly lose by the least delay in this case. Wherefore having placed the Woman conveniently, let him gently put the Head, which offers, back, (provided it be not engaged too low among the Bones of the Passage, and that it may be done without too great violence to

the Woma; nfor in that case * it * See the Preface.

C

h

C H A P. XXVIII.

Of a Labour wherein the Burthen either first offers, or first comes quite forth.

He coming forth of the Navel-string before the Infant, of which we have treated in the foregoing Chapter, is often cause of his death, for the reasons there given: but the coming first of the Burthen, is yet much more dangerous; for besides that the Children are then ordinarily stillborn, if they be not affifted in the very instant, the Mother likewise is often in very great peril of her life: because of her great floodings, which usually happen, when it is loosened from the Womb before its due time, because it leaves all the Orifices of the Vessels open to which it did cleave, whence flows incessantly Blood, until the Child be born: because the Womb, whilst any thing continues there, doth every moment strongly endeavour to expel it, by which means it continually voids and expresseth the blood of the Vessels, which are always open (as we have already often explained) when the Burden is fo feparated, as long as the Womb remains extended and cannot be closed, until it hath voided all that it did contain, and comes by the contraction of its membranous substance to stop them, by pressing them together. Wherefore if we ought to be vigilant to fuccour an Infant when the String comes first, we ought much more to be so when the Burden comes forth first, and the least delay is ever cause of the Infant's sudden death,

CH

death, if the Woman be not speedily delivered; because the Infant cannot stay then long in the Womb without suffocation, standing then in need of breathing by the Mouth (as is explained in the foregoing Chapter) the Blood being no longer vivified by the preparation made in the Burthen, the use and function of which then ceaseth, from the instant it is separated from the Vessels of the Womb, to which it was joined, for which reason there immediatly follows a great flooding, which is fo dangerous for the Mother, that without speedy help, the foon lofeth her life by this unlucky ac-

cident.

0

re

nt

re

nd

as

h,

When the Burthen is not wholly come forth, but lies in the Passage, some advise to put it back before the Child be fetcht; but I am not of that opinion, for when it comes into the Passage before the Infant, it is then totally divided from the Womb, at the bottom of which it ought ordinarily to be scituated and fastned, until the Child be born : but, because (as soon as it is wholly loosened, as it always is when it comes first) it becomes a Body altogether unnatural; it must never be thrust back, but on the contrary be fetched away. and at the very moment after bring the Child by the Feet, altho it came naturally with the Head first: for what reason can there be to put it back. fince it is of no use to the Infant, from the moment it is separated from the Womb, as cannot be denied? And fuch a proceeding is so far from being useful, that this Burden would much hinder the Chirurgeon from being able to turn the Child as he ought, to bring it by the Feet.

Wherefore when it presents in the Passage, which

may be foon perceived, if they find every where a loft fubstance, without the least resistance to the touch of any folid part; finding likewife the String fastned to the middle of it, and the Woman flooding exercamly, as is ordinary at such times; then, instead of thrusting it back, the Burthen must be brought away, that fo there may be more liberty and room to extract the Child, according to former direction.

The Burden being quite loofened from the Womb, and coming first in the Passage, must not be thrust back into it again, much less must it be put back, when it is quite come forth of the Body. Care must be only taken that the String be not cut till the Child be born, not out of hopes of any benefit from it to the Infant during the Delivery, but that so much time may not be lost before the Infant be fetch'd, which is then ever in great danger, as also the slooding may be the sooner stopt, which happens for the most part as soon as the Woman is delivered, for which reasons it must be with all possible speed dispatched.

Sometimes, notwithstanding this dangerous accident, the Child may be born alive, if timely succoured: but it is then so weak, that its hard to discover at first, whether it be living or dead.

When it so happens, the Midwives do ordinarily before they separate the Burden, put it into a Skellet of hot Wine, and imagine, with no small Superstition, that in case it comes to it self, the vapours of the warm Wine was the cause of it, being conveyed, by means of the String, into the Infant's Belly, and so giving it vigour: but it is more credible, that being almost suffocated for want

of respiration as soon as it needed it, it begins now by means of it to recover from that fainting: but nevertheless, there is no hurt in keeping the custom, tho superstitious, since it can do no prejudice, and may satisfy preingag'd spirits, provided necessaries be not neglected, in being blindly carried away with this conceipt.

CHAP. XXIX.

Of Floodings or Convulsions in Labour.

The best Expedient and safest Remedy for Mother and Child in this case, who are both in great danger, is to deliver the Woman presently, without any delay, fetching the Child away by the Feet, at what time soever of the Woman's being with Child, whether at full reckoning or no. [The Author you see was only a Chirurgeon.]

I have at large directed in the 20th Chapter of the first Book, speaking of Floodings, what ought to be done in these cases, where I related the sad Story of one of my Sisters, which I shall not again repeat, being too sadly affected with it; but refer the Reader to that Chapter for sufficient directions in these dangerous accidents.

CHAP. XXX.

se nool anno

How to deliver a Woman when the Child's Hydropical, or Monstrom.

A Child may in the Womb have either the Dropfy of the Head, called Hydrocephale, or of the Breaft, or of the Belly: And when these parts are so filled with Water (as I have sometimes mer with) that they are much too big for the Passage through which the Child must issue; then, notwithstanding any Throws or Endeavours the Woman may attempt to bring it forths, it impossible she should effect it without the help of Artical likewise when the Child is monstrous, either by being only too big in the whole Body, or in any particular part, or by being joined to another Child.

If the Child be living that hath the Droply, when the Woman is in Labour, it must be destroyed to fave the Mother, by making a hole in either the Head. Breast, or Belly of it, where the Waters are contained, that being emptied by the apertion so made, the Child may the easier be drawn forth, or else he must necessarily die in the Womb, not being able to be born, and remaining there will also kill the Mother; wherefore to save her life,

the Infant must be by an indi-*See the Preface. spensable * necessity brought

forth by Art, fince 'tis impossible it should come of it felf, which may be done with a crooked Knife sharp at the very point, like

at

After that the Woman is placed conveniently for the Operation, he must slide up his left Hand on the right fide of the inferior part of the Infant's Head, if the Waters be contained therein, which he will perceive by the extraordinary bigness and extent of it, the Sutures much separated, and the Bones of it far distant one from the other, by reafon of the diftention made by the inclosed Waters, of which being very certain, let him flide with his right Hand along the infide of his left this crooked Knife, taking care that the point of it, in introducingit, be always towards his left Hand, for fear of wounding the Womb, and having conducted it close up to the Head, against one of the Sutures, let him turn the Knife towards it, and make an apertion large enough to let out the Water, and then it will be very easy to bring forth the Child; foralmuch as the other parts are then usually small and much confumed.

If these Waters were contained in the Breast or Belly, then the Child's Head, being no bigger than ordinary, may be born; but the Body being exteedingly swelled with the Waters will stay behind; as it happened to that Child that had a Dropsy of the Belly, which I mentioned in the 19th Chapter of this Book, to which I refer you,

because 'tis much to this purpose.

The case being thus, let the Chirurgeon slide up his left Hand, as aforesaid, and the Instrument with the right, just to the Breast or Belly, to make un Incision, just as I did in the same case related in the

You must know, that 'tis much more difficult to deliver a monstrous Birth, or two joined together, than one that hath the Dropsy: because the bigness of the Hydropick parts may be easily lettened by a single incision, which is sufficient to let out the Waters which distend, and then 'tis easy to

dispatch the rest,

But when a monstrous Child, or a double ones to be extracted, a fingle apertion is not enough but fometimes 'tis necessary to take off whole Men. bers from those Bodies, which makes the Operation on much more painful and laborious, and require more time and skill to effect it; in which case the left Hand must be introduced into the Womb, and the sharp Knife of the right just to the parts that are to be divided and separated, and there with all the care that, may be, the Member of the monftrous Child must, if possible, be taken off just at the loint; and when there are two Children joined together, the Separation must be made just in the place where they join, and afterwards they may be delivered one after the other; always taking them by the Feet; and if it hath but one, the fame thing may be accomplished, after having leffened the higness of it, by cutting off some one of the Members

I have already shown, in Chap. 15. of this Book, speaking of the extraction of a Child's Head lest alone behind in the Womb, of what fashion this Instrument ought to be, that the Operation may be conveniently performed, and that it should be a long as an ordinary Crochet, for the more surety

cannot bring it forth, and fometimes the hath none at all; for almuch as Nature half overthrown by the death of the Child, which cannot help it felf. labours fo little, that many times it cannot finish the business it hath begun, but must yield without the help of Art, of which at that time it hath great need: However, before you come to Manual O. peration, endeavour to stir up the Woman's Pains with tharp and ftrong Clysters, to bring on Throws to bear down and bring forth the Child: but if this prevails not, she must be delivered by Art.

We have declared in Chap. 12. of this Book, the figns to know a dead Child in the Womb, of which the chief are; if the Woman perceives it not to ftir, nor hath a long time before; if the be very cold, much pain and heaviness in the bottom of her Belly; if the Child be not supported, but always falls like a mass of Lead to that side on which the Woman lies; if the Burthen or Navel-flring hath been a long time in the World; and if no Pulsation be there felt, and that dark and stinking putrid matter comes away from the Womb. All these figns together, or most of them, shew the Child is affuredly dead; which when the Chirurgeon is certain of, he must do his endeavour to fetch it as foon as possible he can, and having placed the Woman according to former directions; if the Child offers the Head first, he must gently put it back, until he hath liberty to introduce his Hand quite into the Womb, and fliding it all along under the Belly to find the Feet, let him drawit forth by them, as is formerly taught; being very careful to keep the Head from being lockt in the Passage, and that it be not separated from the Bo

dy,

dy, which may easily be done when the Child being very rotten and putrified, the Chirurgeon doth not observe the circumstances often repeated by us, that is (in drawing it forth) to keep the Breast and Face downwards: And if, notwithstanding all these precautions, the Head, because of the great putrefaction, should be separated and remain behind in the Womb, it must be drawn forth according to the directions formerly given in the proper Chapter.

But when the Head coming first, is so far advanced and engaged among the Bones of the Passage, that it cannot be put back, then being very sure by all the signs together, or most of the chief of them, that the Child is certainly dead, 'tis better to draw it so forth, than to torment the Woman too much by putting it back, to turn it and bring it by the Feet: but because it being a part round and slippery, by reason of the moisture, the Chirurgeon cannot take hold of it with his Fin-

Chirurgeon cannot take hold of gers, nor put them upon the fide of it, because the Passage is filled with its bigness, he must take a * Crochet, like one of those marked A & B, amongst the Instruments at the end of this Second Book, and put it up as far as he can without violence, between the Womb and the Child's Head, observing to keep the point of it towards the Head, where he must fasten it, endeavouring to give it good

If the dead Child (of which above all there must be good assurance) comes with the Arm up to the Shoulders so extreamly swelled, that the Woman must suffer too much violence to have it put back, 'tis best then to take it off at the Shoulder-joint, by twifting it three or four times about, as we have already taught in another place, by which means there is no need of either Knives. Saws, or sharp Pincers, as some Authors will have it; it being very easily performed without all that provision, because of the softness and tenderness of the Body: After that, the Arm so separated and no longer possessing the Passage, the Chirurgeon will have more room to put up his Hand into the Womb to fetch the Child by the Feet, and bring it away as hath been directed.

Altho the Chirurgeon be fure the Child is dead in the Womb, and that it is necessary to fetch it by Art, he must not therefore presently use his Crochets, because they are never to be used but when Hands are not sufficient, and that there is no other remedy to prevent the Woman's danger, or to bring the Child any other way; because, very often, tho he hath done all that Art directs, perfors present, that understand not these things, will believe that the Child was killed with the Crochets, altho it had been dead three days before, and without other reasonings or better understanding of the matter, for recompense of his saving

faving the Mother's life, requite him with an Ac cufation, of which he is altogether innocent and, in case the Mother by misfortune should as terwards dye, lay her death also to his charge and instead of Praise and Thanks, treat him like a Butcher or Hangman; to which divers Midwives are usually very ready to contribute, and are the first that make the poor Women, that have need of the Men, afraid of them. So much they are in fear of being blamed by them, for having themselves been the cause (as some of them often are) of the death of Infants, and many Accidents which after befal the poor Women not causing them to be helped in due time, and from the moment they perceive the difficulty of the Labour to pass their Understandings.

To avoid therefore these Calumnies, let the Chirurgeon never use the Crotchets but very rarely, and when there is no other way, as also to endeavour his utmost (as much as the case will permit) to bring the Child whole although dead, and not by bits and pieces, that thereby the wicked and ignorant may have no pretence of Blame; I say, as much as the case will permit, that is, with respect to the Woman under his Hands: for to save her, he had better sometimes bring the dead

* Those Instruments are very unfafe for the Woman, and having a better way, cannot pass them without manifesting my dislike. Child with * Instruments, than kill her, by tormenting her with excessive Violence to bring it whole: but in a word, we must in Conscience do what Art commands, without heed to what may be spoken afterwards, and every

every Chirurgeon, that hath a well ordered Conscience, will ever have a greater regard to his Duty than Reputation; in performing of which let him expect his reward from God. ic cleaves very incomply to the bor

CHAP. XXXII.

Of extracting a Mola and false Conception.

Aving at large spoken in another place of the Caules, Signs and Differences of Mola's and false Conceptions, and shewed that a Mola always ariseth from a false Conception, there remains nothing to be demonstrated but the manner how tought to be extracted. Now fince these things contained in the Womb, are totally preternatural, their expulsion must be procured assoon as possible, which is very difficult, when these strange Bodies leave to it, and especially the Mola, which not being drawn forth, will often continue so fastned wo or three whole Years, nay fometimes the whole remaining part of the Womans Life, as Parce tells is in the Story of the Pewterers Wife that had one leventeen Years, whom he opened after her death.

To avoid the like Accident and abundance of nconveniences which a Mola brings, it must be ndeavoured to be expelled affoon as may be, tryng, before you come to manual Operation, to cause he Woman to expel it of her felf: to which purofe give her frong and sharp Clysters, to stir up Throws to open the Womb to give way to it, elaxing and moistening it with emolient Ointtents, Oyls and Greafe, not omiting bleeding in the

the Foot, and half Baths, if there be occasion The Mola will certainly be excluded by the means, provided it be but of an indifferent bigness, or that it adheres little or not at all to the Womb; but if it cleaves very strongly to the bot. tom of the Womb, or that it be very big, the Woman will hardly be rid of it without the helpof a Chirurgeons hand; in which case, after that he hath placed the Woman conveniently, as if he were to fetch a dead Child, let him flide his Hand into the Womb, and with it draw forth the Mile using (if it be so big as that it cannot be brough whole, which is very rare, because it is a soft tender Body, much more pliable than a Child) a Crochet or Knife to draw it forth, or divide it into two or more parts, as the case shall require If the Chirurgeon finds it joyned and fastened to the Womb, he must gently separate it with his Fingers ends, his Nails being well pared, putting them by little and little between the Mola and the Womb, beginning on that fide where it doth not flick fo fast, and purfuing it so until it be quite loofened; being very careful, if it grows too fall not to rend nor hurt the proper substance of the Womb, proceeding according to the directions we have given for the extraction of a Burthen flaving behind in the Womb when the String is broke off.

This Mola never hath any String fastened to it, nor any Burthen from whence it should receive it Nourishment: but it doth of it self immediately draw it from the Vessels of the Womb, to which it is most commonly joined, and sticking in some place. The substance of its fleshes lasto much

more

more hard than that of the Burthen, and sometimes it is schirous, which is the cause, why it is

not fo easily feparated from the Womb.

As to a falle Conception, though it be much less than a Mola, yet it often puts a Woman in hazard of her Life, because of great Floodings, which very often happens, when the Womb would discharge it self of it, and endeavour to expel it: which seldom ceaseth until it be come away; because it doth still endeavour to exclude it, by which the Blood is excited to flow away, and in a manner

gueefed out of the open Vellels.

The best and safest Remedy for the Woman in his cafe, is to fetch away the false Conception floor as may be, because the Womb can very selfom and with much great diffiulty void it without elp; for it being very fmall, the Womans impulle in bearing downwards cannot be fo effectual when the Womb is but little diftended by fo small Body, as when it contains a confiderable Bulk it; for then it is more ftrongly compressed with he Throws. Many times 'tis exceeding difficult to etch these false Conceptions, because the Womb oth not open and dilate it felf ordinarily beyond he Proportion of what it contains, and that being ery little, fo is its opening; which is the reason why the Chirurgeon fometimes is fo far from inroducing his whole Hand, that he can scarce put n a few Fingers, with which he is obliged to finish he Operation, as well as he can, proceeding in the ollowing manner when he hath introduced them.

Having well anointed his Hand, he must slide tup the Vagina unto the inward Orifice, which will find sometimes but very little dilated, and

then very gently put in one of his Fingers, which he must presently turn and bend on every side, until he hath made way for a fecond, and afterwards a third, or more if it may be done without Violence; but many times one hath enough to do get in but two, between which he must take how (as Crabs do with their Claws when they take any thing) of the false Conception, which he must gently draw forth, and also the clodded Blow which he there finds; afterwards the Flooding will undoubtedly cease, if no part of this Conception be left behind, as I have often found by experience when I have taken the same course: but if the inward Orifice cannot be more dilated than to admit but one Finger, and that the Flooding is fo violent as to endanger the Woman's Life, the Chirurgeon then having introduced his Fore-finger of his left Hand, must take with his right an Instrument, called a Cranes Bill, or rather a Forceps (like that marked G, among the Instruments at the end of this fecond Book,) and guide the end of it along his Finger, to fetch with this Instrument the strange Body out of the Womb, taking heed that he pind not the Womb, and that the Instrument be at was conducted by the Finger first introduced which will judg and distinguish by the touch be tween this Conception and the Substance of the Womb: in doing which, there being no other way, he will certainly accomplish his business.

I thought of causing such an Instrument to be made upon an occasion, where it would have show me in good stead, if I had had it, with which have since (proceeding according to the Directions I have just now given) lately drawn forth

falle

false Conception of the bigness of a Walnut, which without doubt had else that day been the death of one named Madam le Roy, dwelling near the great Stairs at the place Manbert, by reason of the horrible loss of Blood which it occasioned, and which ceased assoon as I had drawn forth this Conception; which I could never have done any other way, because the inner Orifice of the Womb was not open, nor could be dilated more than for one Finger alone, after the manner I have declared: besides the pressing danger of the Accident, the delay of the Operation had indubitably been the death of this Woman, who, thanks be to God, is since well recovered.

CHAP. XXXIII.

Of the Casarean Section.

When a big-bellied Woman is effectively in Labour, 'tis very rare but that an expert Chirurgeon can deliver the Child dead or alive, whole or in pieces; in a word, that he may do the work compleatly, if he behaves himself as the case requires, and according to the Directions given in each particular Chapter foregoing, treating of the several unnatural Labours, without being necessitated in a very inhuman, cruel and barbarous manner to have recourse to the Casaream Operation during the Mother's Life, as some Authors have too inconsiderately ordered, and sometimes practised themselves.

In truth there would feem some pretext of a law. ful excuse to make Martyrs of these poor Women, if it were to bring a fecond Cafar from them, whom they fay was born in that manner, or some great and new Prophet. In the time of the ancient Pagans they did use to facrifice innocent Victims for the publick good, but never for a private. I know very well that they palliate it with a pretence of baptizing the Infant, which else would be deprived of it, because the Mothers death is for the most part the * cause of the

* Rather the occasion. Childs: but I do not know that there ever was any Law,

Christian or Civil, which doth ordain the martyring and killing the Mother, to fave the Child: 'Tis rather to fatisfy the Avarice of some People, who care not much whether their Wives die, provided they have a Child to furvive them; not fo much for the fake of Children, but to inherit by them afterwards; for which cause they do easily confent to this cruel Operation, which is damnable Policy. If they fay, to render the Fact less horrible in appearance, that it must never be undertaken but when the Woman is reduced to the utmost extremity; to that I answer, that a Woman often recovers beyond hope or probability: And, if they object that the may likewife escape after this Operation; I do utterly deny it, by the Testimony of the most expert Chirurgeons that have practifed it, who always had bad fuccess, all the Women ever dying in a short time after. I do highly commend Guillemean, who to disabuse the World for such a wicked and pernicious Practice, confesseth, speaking of this fatal Operation, and

ownes

ownes (by way of repentance) that he did himfelf twice in the presence of Ambrose Pares put it into practice, and saw it thrice done more by three several very expert Chirurgeons, who omitted never a circumstance to make it succeed well; and

notwithstanding all, the Women died.

t.

As for Paree, he will not acknowledg that he faw those two Operations of Guillemean, because he will not have Posterity know that he was able to confent to fo great a Cruelty; but contents himfelf with advising only, that it should never be undertaken till the Woman is dead; because there is no possibility she should escape it, not only because of the irregular wound, which must of neressity be made for this purpose in the Belly, but chiefly for that in the Womb; and for the exceffive Flux of Blood which will immediately follow. However, contrary to the opinion of two fuch famous Chirurgeons, there are some rash Persons, who do obstinately maintain (though with but as little reason as Rousset) that it is not impossible for a Woman to esape, because they have feen some that have had the Bones of their dead Children come forth by an abscess of the Bely, after that the Flesh of them had passed the natural way in Suppuration, which Bones by little and little had pierced the Womb and the Belly alfo, and after that they were fo drawn forth; yet the Women recovered. As also others did not die, whose Wombs after Precipitation and perfect putrefaction and Gangrene, was totally cut away. Indeed we must acknowledg what experience hath many times taught us, as it hath these things, which I believe have happened, and may again as well

tl

well as those (though rarely): but it doth not follow, that this Cafarean Operation must need succeed as well; because here is made at one stroke a very great Wound in the Belly and Womb, which is ever the death of the poor

Woman immediately, or foon after.

But when Nature it felf begins to feparate and pierce these parts, by means of these Bones, to call them forth by fome new way which it makes, nor being able to do it by the common and natural for want of the help in due time of skilful Persons, it doth it by degrees and not all at once; and according to the measure it drives these preternatural Bodies forth of the Womb, fo it reunites and rejoyns it at the fame time proportionably, and without the least Flux of Blood, which happens quite otherwise in the artificial Operation: and if it be true, that some Women have ever escaped it, we must believe it a Miracle, and the express Hand of God, (who can when He pleafeth raile the dead, as he did Lazarw, and change the course of Nature, when 'tis his good pleafure) rather than an effect of human Prudence.

There are many good Women who, for having only heard some Gossips speak of it, are very confident that they know such and such yet living, whose sides had been so opened to fetch the Child out of their Belly. Nay more, there are some that affirm they know those that have had this Operation practised on them three or sour times successively, and yet alive; and the better to confirm so notable a Lye, which they had only heard recited by others, and after having three or sour times told it, believe it themselves for truth, as

much

much as if they had feen it with their own Eyes, will tell fo many circumstances and particulars, that they casily persuade those into a Belief that

do not understand the impossibility of it.

There are others again, who shewing the Scars of some Abcess they have had in their Belly, would persuade that a Child hath been taken out there; to which purpose I will relate what I once saw my felf, concerning a big-bellyed Woman that was in the Hoftel de Dien at Paris, when I there practifed Deliveries. This Woman, whether through cunning, feigning, or through Ignorance, really believing it, did testify to all the Women who were then in the faid Hoftel de Dien, as also to an infinite of other Persons, and amongst the rest to a good old Nun that governed all, whom they called Mother Bouquet, (and at that time did preside in the Hall of Deliveries, like another Goddes Lucina) that the was very much afraid that they must open her side to deliver her, as it had been two years before; in all which time the had made the fame relation to above a thousand several Persons, each of which, it may be, had again related it to as many more, shewing to all of them a great Scar, by which the faid the Chirurgions had drawn the Child out of her Belly. Wherefore she prayed Mother Bouquet, to recommend her to me, defiring rather to be delivered by me who was a Chirurgion, because the might be more safely helped in such a business, than by a Midwife. This good Nun giving me this account, which she verily believed according to the relation; I told her, that not having Faith enough to imagine it, I could not believe the Casarean Section had been made on that Woman,

er

man, as the had perfuaded her. If you do not be lieve it, replyed the, I will fetch her prefently to you, and the her felf thall tell you every circumftance. And immediatly the caused her to be fetch'd who told methe fame fhe had related to her : but having particularly examined her from what part the Child was so drawn forth, and whether she felt any great pain in the Operation. She answered me None because the was then senseles, and remained fo five or fix days after: I asked her then, how the was certain that the Child was brought away by incision in her Belly, being she was not at that time fenfible? She answered, the Chirurgion affired her it was fo: and at the same time she shewed me a great Scar, scituated just on the right fide of her Breast, about the middle of the Ribs, where she had a great Abcess, of which this Scar remained; and when I had told her, that the Breaft was not the place whence a Child should be fetcht, and that I had with my Arguments convinced her of the impossibility of what she had believed, and made others believe, as the Women of the Hoftel de Dien and Mother Bouquet also; they began to be difabused and continued so, when three days after this conference, I had delivered her with the greateft facility, altho it was a very great Child, which came quickly. If one should examine well the beginning of all the Stories of this Operation strictly weighing them, as I did upon this occasion, they would be found to be meer Fables, and that that which Roufer reports of his Cafarean Labours, is nothing but the ravings, capriciousness and imposture of their Authors.

Now if, because of all these reasons, a Chirurgi-

on must never practise this cruel Operation whilst the Mother is alive, altho the Child be certainly fo (which for all that may sometimes be very doubtful) I pray what Infamy would it be for him, if having so killed the Mother, the Child should also befound dead, after it was thought to be alive? much more ought he to abstain from it, when he is well affured it is dead; wherefore he had better pull it in pieces and bits(if it cannot be otherwise) by the natural way, than to butcher the Mother to have it whole; and if the Womb were so little open, that he could not have liberty to work there, nor introduce any Instrument into it, he had better wait a little, always trying to dilate the Passages by Art, as we have formerly directed, than to cast her down almost in an instant, with such a blow of despair, as the making of this Casarean Operation, which for this reason is never to be undertaken. till immediatly after the Mothers death, when the Chirurgion must be present to act according to the following directions, as well in hopes of finding the Child living, as to obey an Ordinance which exprefly forbids the burying a Woman with Child before it is taken out of her Belly. To accomplish which as it ought to be, when he perceives the Woman in the Agony, he must quickly make ready all things necessary for his work, to lose no time, because delay will certainly be the death of the Infant, which else a few moments before might have been brought alive: there are fome, that when the Woman is just a dying, would have somewhat put between her Teeth to keep her Mouth open, and likewise in the outward part of the Womb: to the end the Infant receiving by this means some little

p

Air and Refrestment, may not be fo foon fusto. cated : but all this Mystery will avail but little: because the Child lives only by the Mothers Blood. whilst it is in the Womb; but if he will needs do fo, it is rather to content the Company, than out of any belief of the good it will do. Alloon then as the Woman hath breathed her last, and that fhe is dead (to which all the Company must agree) he shall begin his Operation, which the Greek call Embriulcie. Most Authors would have it made on the left fide of the Belly, because it is more free from the Liver, which is on the right; but if my Opinion may be authentick, it will be better and more skilfully made just in the middle of the Belly, between the two right Muscles; because in this place there is only the Coverings and the white Line to cut when on the fide it cannot be done without cutting the two oblique and cross Muscles, which being couched one under the other, makes a confiderable thickness, besides that it bleeds more then towards the middle of the Belly; not that the lofs of Blood is of any moment (which will flow when the Woman is but just dead) but because it hinders by its flowing, the feeing distinctly how to make the Operation as it should be. patch then with more ease and speed, the Chirurgeon having placed the dead Body that the Belly may be a little raised, let him take a good sharp Incilion Knife, very sharp of one side, like that marked E in the Table of Instruments at the end of this Chapter, with which he must quickly make, at one stroak, or at two or three at most (if he will for the greater furety) an Incision just in the middle of the Belly, between the two right Muscles unto the Peritoneum

Peritaneum, of the length and extent of the Womb or thereabouts; after that he must only pierce the Peritaneum with the point of his Instrument, to make an Orifice for one or two of the Fingers of his left Hand, into which he must immediately thrust them to cut it (lifting it up with them, and conducting the Instrument for fear of pricking the Guts) in proportion to the first

Incision of the * Coverings, which * Skins. having done, the Womb will soon

appear in which he must make an Incision in the fame manner as he did in the Peritoneum; being careful not to thrust his Instrument at once too far in, thinking to find the Womb a finger or two thick, as all Authors affirm contrary to truth, in which he would be deceived, as those are that never well confidered it: for it is very certain, that at the time of Labour, whilst it contains the Child and Waters in it, it is not above a fingle line thick, or the thickness of a half Crown, although they have all fang to us, that by divine Providence and a Miracle, the more 'tis extended with the Child, the thicker it grows, which is absolutely false; it being only true, that it is at that time a little thicker at the place where the Burthen cleaves, where its fubstance is then as it were spongious; but every where else it is very thin, and becomes the more fo by how much it is more extended, until being emptied by the Birth of the Child, it begins to grow thicker in contracting and gathering to it felf all its substance, which was before very much extended. It being just like the Bladder which being full, is very thin, and being empty appears to us of half a Fingers thickness, which filling again

2

П

DI

B,

again, waxeth thinner in proportion to the Urine that flows to it: having then fo opened the Womb, he must likewise make an Incision in the Infants Membranes, taking care not to wound it with the Instrument, and then he will soon see it, and must immediately take it out with the Burthen, which he must nimbly separate from the bottom of the Womb; and finding it to be yet living, let him praise God for having so blessed

and prospered his Operation.

But the Children fo delivered in these cases are usually fo weak, (if not quite dead, as it often happens) that'tis hard to know, whether they are alive ar dead. Yet one may be confident the Child is living, if by touching the Navelstring the Umibilical Arteries are perceived to move, as also the Heart, by laying the Hand on the Breaft; and if it prove fo, means must be used to fetch it to it self, spouting some Wine in the Nose and Mouth, warming it until it begins to stir of it felf. Midwives ufually lay the Burthen very hot on the Belly of fuch weak Children; if that helps, tis rather because of the temperate heat of it, than for any other caufe: for tis impossible the Infant should receive any Spirits from it, after it is once separated from the Womb, and yet less when the Woman is dead. As to the heat of it, it can no wife hurt, but the weight of this mass layed on the Belly, may rather choak it, by the compression it makes, than doit any good; besides, when the Burthen is grown cold, they put it in a Skellet of hot Wine, from whence they think the Spirits renew, which being conveyed through the String into the Child's Belly, gives it new force : but as I have faid already, that is very useless, and the best and speediest Remedy is immediatly to separate it, and open the Child's Mouth, cleaning and unstopping all the Nose, if there be any Filth, to help it so to breath freely, keeping it all the while near the Fire, until it hath alittle recovered its weakness, spouting some Wine into the Nose and Mouth of it, that he may a little taste and scent it, which cannot hurt it in this juncture, if one observes some moderation in the thing.

Having now at large treated in this Second Book as well of natural as unnatural Labours, and given sufficient Instructions to a Chirurgion to enable him to help Women in the first, and to remedy all the different Accidents of the latter, to which he may be daily called, there rests nothing now to finish it, but to represent the Instruments proper to this Art. And then we will pass to the Third Book, where we must handle many things, which they must necessarily know that intend to practise Deliveries.

Explication of the Instruments.

M, A Crochet or Hook to draw forth a dead Child.
B, Another Crotchet for the fame purpose, according as the case requires, either bigger or less, both of them must be strong enough, and very smooth and equal, that the Womb may not be hurt in the Operation, and above ten large Inches long, or thereabouts, and their Handles must be of a moderate bignes, for the firmer holding of them.

C, A

C, Acrooked Knife, equal in length to the Croches, fie for the separating a monstrous Child, or piercing of the Belly of an hydropical Infant, or opening the Head to empty the Brains, or to divide it in pieces, when, because of its bigness or monstrousness, it remains behind in the Womb, separated from the Infants Body.

D; Another small crooked Knife for the same purpose, but not so convenient; because it cannot be guided but with one Hand.

E, A sharp Incision-knife sit for the Cæsarean Settion, soon after the Mothers death.

F, A Cranes Bill, fitted for drawing forth of the Womb any strange Body, or false Conception, when the whole Hand cannot be introduced.

G, Another Instrument for the fame purpofe.

H, A Speculum Macricis, with three branches to open the Womb, to discover Ulcers or other Maladies, sometimes there deeply scituated.

Another of two Branches, for the same purpose.

K, Another yet more commodious.

L, A Catheter to let out the Urine, when the Woman cannot make Water.

M, A Syringe for Injections into the Womb.

The Third Book.

Treating of Women in Child-bed, and of the Diseases and Symptomes befalling them at that time; Of Children new born, and their ordinary Distempers, together with necessary directions to choose a Nurse.

Oing with Child is as it were a rough Sea, on which a big-bellyed Woman and her Infant floats the space of nine Months: And Labour, which is the only Port, is so all of dangerous Rocks, that very often both the me and the other, after they are arrived and disemparked, have yet need of much help to defend them gainst divers inconveniences, that usually follow the Pains and Travail they have undergone in it.

We have directed in the First Book, treating of the Diseases which are incident to Women with Child, how to prevent their suffering shipwrack in this Sea during so long a Voyage. In the Second we have taught, how they may enter this Port, and disembark there with safety by Delivery: It remains then to compleat our Work, that we expound in this Third and last, how the Mother and Child must afterwards be ordered, and declare low at this time to prevent and remedy divers Indispositions

Dispositions which often happens to them both Let us first consider those that are incident to Woman new layd, and then we shall pass to those that regard a new-born Infant.

CHAPILL

What is fit to be done to a Woman new laid and naturally delivered.

Mmediately after the Woman is delivered, and the Burthen come away, care must be taken that the loofening of it be not followed with Flooding, which if it be not, a foft Closure to the Womb must immediately be applied, five or in double, to prevent the cold Air entring in, which fuddenly stops the Vessels, by which the Woman should cleanse by degrees, whereby there would certainly happen many ill Accidents, as grea Pains and Gripes of the Belly, Inflammation of the Womb, and divers others which we shall men tion hereafter particularly, and which may eafile be the cause of her death.

When the Womb is so closed, if the Woman was not delivered upon her ordinary Bed, let he be presently carried into it by some strong body or more if there be need, rather than to let he walk thither; which Bed must be first read warmed and prepared as is requisite, because of the cleanfings; but if the were delivered on i (which is best and fafest to prevent the dange and trouble of carrying her to it) then all th foul Linnen and other things put there for th

receiving

receiving the Blood, Waters, and other Filth which comes away in Labour, must be presently. removed, and the must be placed conveniently in ir for her ease and rest, which she much wants, to recover her of the Pains and Labour the endured during her Travail; that is, with her Head and Body a little raised, to breath the freer and deanse the better, especially of that Blood which then comes away, that so it may not dod, which being retained, causes very great Pains. All this will happen, if they have not liberty to come freely by this convenient scituation. in which she must put down her Legs and Thighs dose together, having a small Pillow (for her greater ease if the desire it) under her Harms, upon which they may rest a little: being so put to Bed. let her lye neither of one fide nor the other, but luft on the middle of her back, that fo the Womb may reposses its natural and proper place.

en ha

It is an ordinary cultom to give the Women, also as they are delivered, two Onces of Oyl of sweet Almonds, drawn without Fire, and as much syrup of Maiden-hair, mixed together, which is as well for to sweeten and temper the inside of the Throat, which was heated and hoarse by her continual Cries, and holding her Breath to bear down her Throws during her Labour, as also to the end that her Stomach and Intestines being lined with it, should not be so much afflicted with dolorous Gripes: But this Potion goes so much against the Stomachs of some Women, that being forced to take it with an averson and disgust, it may do them rather more hurt, than any wise comfort them. Wherefore let none have it but those that

a defire

defire it, and have no Aversion to it. I approve rather in this case of a good Broth to be given her alfoon as the is a little fettled after the great com: motion of Labour ; because it will be both more plealing and profitable than fach a Portion. And having thus accommodated her, and provided for her Belly, Breafts and lower parts, after the manner we shall direct in the next Chapter, leave her to rest and sleep if she can, making no noise, the Bed curtains being close drawn, and the Doors and Windows of her Chamber thut, that fo feeing no light, the may the fooner fall afleep. If the had endured a hard Labour, the must be then ordered as the case requires, and as Thall be hereafter declared: but what we have here directed, is only for a natural Labour, and where no extraordinary difficulty happens.

malf off of the Women define Women

netural and the or place

Of convenient Remedies for the lower parts of the Belly and Breasts of Women newly delivered.

Since the lower parts of a Woman are greatly distended by the Birth of an Infant, it is good to endeavour therefore the prevention of an Inflammation there: wherefore assoon as the Bed is cleansed from the foul Linen and other Impurities of the Labour, and that the Woman is therein placed, according to the direction of the preceding Chapter, let there be outwardly applied all over

the bottom of her Belly, and Privities, the following Anodine Cataplasm, made of two Ounces of Oyl of sweet Almonds, with two or three newlaid Eggs, Yolks and Whites, stirring them together in an Earthen Pipkin over hot Embers, till indomes to the consistence of a Pultiss, which being spread upon a Cloth, must be applied to those parts, indifferently warm, having first taken away the Closures, (which were put to her presently after her Delivery) and likewise such clods of Blood as were there left.

This is a very temperate Remedy, and fit to appeale the Pains which Women ordinarily luffer in those parts, because of the violence then endured by the Infants Birth: it must lie on five or fix Hours, atd then be renewed a fecond time if there be occasion: afterwards make a Decoction of Barley, Linfeed, and Chervil; or with Marsh-Mallows and Violet leaves, adding to a Bint of it, an ounce of Honey of Roles, with which, being like warm, foment three or four times a day (for the first five or fix days of Child-bed) the bearingplace, cleanfing it very well from the Blood, Glods aud other Excrements which are there emptied. This Stupe is likewise very good to temper and appeale the Pains of those parts. Some perfons only use to this purpose luke-warm Milk; and many Women, only Barley-water. Great care must be taken at the beginning that no stopping things be given to hinder the cleanlings, but when in or twelve days are past, and that she hath deansed very sufficiently, Remedies may then be used to fortify the parts, to which purpose a Deoction is very proper, made of Province-Roses,

Leaves and Roots of Plantane, and Smith's water that Iron is quenched in ; and when she hath suf ficiently and fully done Cleanfing, which is usually after the 18th or 20th day, there may be made for those that defire it, a very strong aftringent Lot on, to fortify and fettle those parts which have been much relaxed, as well by the great extension they received, as by the humours with which they have been fo long time foaked. This Remedi may be composed with an Ounce and an half of Pomegranate Peel, an Ounce of Cypress Nuts, half an Ounce of Acorns, an Ounce of Terra Sigillara a handful of Province-Roses, and two drachms of Rock-Allum: all which being infused a whole night in five half Pints of strong red Wine, or (that it may not be too (harp) a quantity of Smith's water mixed with that Wine; afterwards boil it well to a Quart, then ftrain it, squeezing of it strongly, and with this Decoction foment those inferiour parts Nights and Mornings, to the end they may as much as possible be stregthened and confirmed: I fay as much as possible; because there is no probability that they can ever be reduced to the fame estate they were in before she had Children. So much for this: We'll now pass to convenient Remedies for the Belly of a new-laid Woman.

All Authors do appoint, immediately after Delivery, the Skin of a black Sheep flaid alive, for this purpose, to be laid all over her Belly, and to lie on four or five Hours; others will have a Hare-skin. Truly I believe that by reason of the natural heat of such Skins, the remedy is not bad: but I also fear left in some small time after it may do the Woman more hurt than good, and that by its Moistness,

cooling

th

or

ha

ve

an

be ste cooling of her, it may make her chill, which would be very prejudicial in stopping her Cleanings, which ought to flow: besides it is a Remedy of too much trouble; for there must always be a Butcher ready for every Woman that is laid, or some other Person that can do it as readily, who must be for this purpose in the very Chamber, or at least in the House, that so they may have the skin very hot according to directions.

They likewise direct a small Plaister of Galbanum, with a little Civet in the middle, to be applied to the Woman's Navil, which as they imagine is very proper to keep the Womb in its place, because being delighted with that smell, it draws

near to it of its felf, but this remedy is a little * Superstitions: wherefore I am not for it, it being sufficient to keep the Belly very warm, in the situation we have directed, and prevent the least cold.

parts

defective the least compression of the Womans Belly, which is then very sore, as the Womb also is, having been much harrased, proves a great inconveniency to her, wherefore let her not be swathed until the second day, and that very gently at the beginning. Midwives believe that they serve instead of a Boulster, as well for the keeping the Womb up in its place, as to squeeze out from all

parts the Cleanfings which are necessary to be evacuated : And Nurse-keepers, abused with this belief, do fonetimes swath their Bellies fo strain that they bruise the Womb, which is very painful in the beginning of Child-bed, and from whence often follows very dangerous Inflammations.

These Swaths and Boulsters can have no hold to support the Womb as they imagine, forafmuch as its * Fund, which * Bottom of the Womb, is the principal part being flitting in † Lower the Cavity of the + Hypogaster, cannot be kept stable and firm by that Belly.

which is applied upon the Belly, and belides the Interpolition of the Bladder which is apon it, will not permit it-

As to their opinion that fuch Swathings helpto cleanse the Womb, 'tis fit they should be disabused of this Error; for it is not the same thing in these Cleanfings, as preffing the juice out of boil'd meat in a Napkin, for these are wholly a work of Nature, which a strong compression (instead of helping). hinders, by the pain it causes to the Womb, and the Inflammations that follow. Without dwelling then upon the ordinary manner of Swathing, let us be guided according to the dictates of Reason, and not according to the Nurf-keepers naughty Customs, whose Method is first to put upon the Belly a Swath four or five double, of a triangular Figure, to support (as they pretend) the Womb, and fometimes two other Roulers very strait, on each fide towards the Groin, to keep it in its place, left it be shaken, and encline more to one side than t'other, with yet another broad square Swath for the whole Belly, which they put upon the first, after-

dierwards they make a Swath a Napkin folded two or three double, of the breadth of a quarter of an Ell, with which they do very much girt and

ompress the Belly.

Ido very well approve of the use of these Swaths, and of a good large square Boulster over the whole Belly, provided they be very loofe the first feven or eight days, only to keep it a little steady, oblerving in the mean time to take it off, and remove it often, to anoint the Woman's Belly all over (if it be fore, and that she have After-pains) with Oil of sweet Almonds and St. John's Wort mixed together, which may be done every day: But after that time, they may by degrees begin to swath her fraighter, to contract and gather together the parts, which were greatly extended during her going with Child, which may be then very fafely done; because the Womb by those former cleanfings is so diminished and lessened, that it cannot be too much compressed by the Swaths. Let us now fee what is fit to be done to the Breafts.

Proper Remedies may be applied to them to drive back the Milk, if the Woman will not be a Nurse, of which we shall speak hereafter; but if she intends to nurse, 'twill be sufficient to keep her Breasts very close, and well covered with gentle and soft Clothes, to keep them warm, lest the Milk curdle in them; and if there be danger of

too much * Blood being

not the Breast the same day she is brought to Bed, because then all her Humours are extreamly moved with Pains and Agitation of the Labour wherefore let her defer it at least till next day, and it would be yet better to flay four or five days, or longer, to the end the great Conflux of the Milk and the abundance of Humours which flow to the Breafts in the beginning may be fpent, in which time another Woman may give it fuck. Let us now discourse of a fit Diet for the Woman to use, during her whole Child-bed.

CHAP. III.

What Diet a Woman in Child-bed ought to observe during the whole time of her lying. in, when it is accompanied with no ill Accident.

A Lthough a Woman be naturally delivered, yet notwitstanding the must observe a good Diet, to prevent many ill Accidents, which may happen to her during her Child-bed; at the beginning of which the must be directed in her Meat and Drink, almost as if she had a Fever, that so it may be prevented, inafmuch as she is then very fubject to it; so likewise it often happens to her through the least neglect committed towards her in her tending.

For this Reason one must not be of the opinion of many Nurfe-keepers, who will have a new-laid Woman to be well fed, as well to restore her lost Arength hrength, by the tediousness of the Labour, and by the quantity of Blood then evacuating, for which cause they believe the Woman must be well nou-rished to make more Blood, as also to fill up her Belly, which is very much emptied by the Birth of the Child: but it is much better to follow in this the counsel which Hippocrates gives us in his tenth Aphorism of the second Book, where he says, Impura corpora quo plus nutriveris, eo magis laseris; The more you nourish impure Bodies, the more you hurt them. * Now it

is certain that a Woman * Did not this Imnewly delivered is of this purity lie in her Bofort, as you may know by dy before Labour?

the quantity of Cleansings and Superfluities which flow

and Superfluities which flow from her Womb at this time, when for this reason they must be very regular in their Diet, especially the three or sour first days, in which time she must be nourished only with good

Broaths, † new-laid Eggs, † Not to be comand Jellies, without using at mended.

the beginning more folid

Meats; but when the great abundance of her Milk is a little past, she may with more safety eat a little Broth at her Din-

per, or a fmall | piece of | So she may the wild Chicken, or Mutton, first day.

as the likes best; afterwards,

if no accident happens, they may by degrees mourish her more plentifully, provided in the mean time, that it may be a third part less than he was accustomed to take in her perfect Health, and that her Food be of good and easy digestion;

not inflering her to eat any of those Cakes, Tarts, or other Pasteries, which are usually provided at the Child's Baptism. As for her Drink, let it be Prysan, [which is Liquerish, Figs and Aniseeds his led in Water] or at least boil'd Water, being careful not to give it her too cold; the may also (provided she be not Feaverish) drink a little white Wine, well mixed with Water, but not

till after the first five or fix days.

Altho I prescribe this Rule in general for all those who are newly brought to Bed; yet there are fome who must not observe it so exactly as laborious Women, who being of a very strong and robust constitution, require a more plentiful feed. ing, to whom notwithstanding, if they do not change the quality, they must at least retrench the quantity of their ordinary Food, having always respect to what every Person accustoms her self to, which the same Hippocrates doth likewise teach us in the 17th Aphorism of the first Book, where he faith, Animadvertendi Junt quibus semel aut bis, & quibus copiosior aut partie aut per partes Cibus est offerendus, dandum ver aliquid tempori, regioni, atati, & confuetudini. " Great care and notice a must be taken to whom to give meat once only or twice; as also to whom to give more, or to whom less, or by little and little; but some a allowance must be made in respect of Time, "Country, Age and Custom. What we have already faid, shall suffice for direction in their Meat and Drink. Will

The Child-bed Woman must likewise keep her felf very quiet in her Bed, lying on her Back, with her Head a little raised, and not turning often from

from fide to fide, that so the Maria may be the better setled in its first Scituation; the must free herself at that time from all care of business, leaving it to the management of some of her Kindned or friends; let her talk as little as may be, and that with a low voice, and let no ill News be brought to her, which may affect her; because all these things do cause so great a commotion or perturbation of the Humours, that Nature not being able to overcome them, cannot make the necessary evacuation of them, which hath been the death of

many. eren ti b

The Citizens Wives have a very ill Custom. which they would do very well to refrain, that is they canfe their Children to be baptized the second or third day after their Labour; at which time all their Relations and Friends have a Collation in the Child-bed Room, with whom she is obliged to discourse, and answer the Gossips and all Comers a whole After-noon together, with the afual Complements of those Ceremonies, enough o distract her; and the there is scarce any of the Company which do not drink her Health, yet by the noise they make in her Ears, she loses it : resides all this, she is often constrained, out of espect, to forbear the use of her Bed-pan and other necessaries, which are very prejudicial to er: and this happens just at the time when she hight to have most rest; because about the third ay the Milk flows in greatest quantity to the breafts; this is the reason why ordinarily the ext day they have a very great Feaver. She light always to keep her Body open with Clyters, taking one once in two days, which not only

is th

only evacuate the grofs Excrements, but also be drawing downwards, cause her to cleanse the bet ter. When the hath observed this Rule a fortnight or three weeks, which is very near the time of having cleanfed fufficiently, that those parts may be throughly cleanfed before the goes abroad and begins upon a new Score; let her take a gentle Purge made of Senna, Caffia, Syrup of Succom with Rhubarb, which is good to purge the Stomach and Bowels of thoseill Humours, Nature could not evacuate by the Womb, as it did the other Superfluities; this Purge may be repeated if necellary; all which being done, and that no indisposition remain, the may bath once or twice, or wash and cleanse her Body, and afterwards she may govern her felf according to her former Cultom.

CHAP. IV.

How to drive back the Milk in those Women who are not willing to give fuck.

Here are many Remedies used to this purpose, fome of which hinder the afflux of humors to the Breaft, and others diffipate and in part diffolve

the Milk therein contained.

Those which hinder the Humors from plentifully flowing thither, are Oil of Roses well mixt with Vinegar, with which the Breafts are to be anointed all over; or Unquentum Populeum, with Ceratum refrigerans Galent, equally mixt and extended upon a piece of Linnen, or gray Paper, and so applyed to the Breasts. Others use Linnen dipt in luke-warm Verjuce, in which a little Allomis disloved, that so it may be more Astringent; and others lay to them the Lees of Red Wine alone, or mixt with Oyl of Roses.

Those Remedies which distolve and dissipate the

Milk from the Breast is a Cataplasme of the four * Meals, Honey, & Sassron, boiled with the Decoction of Chervil or Sage.

* Of Linseed Fenugreek, Beans, and Fitches.

Others apply Honey only,

and fome others rub the Breast alone with Honey, and put upon it the Leaves of Red-Cabbadg, the great Staulks first being taken away, and they a little deadned before the Fire; this Remedy doth

very readily drive-away the Milk.

There are some which boil Sage and Box Leaves in Urine, with which they do soment the Breasts pretty warm, and lay a Cloth upon them dipt in it. But great care must be taken in the application and change of these things, that the Woman catch not the least cold, as also that no Inslammation or Impostumation be caused, instead of driving back the Milk: Wherefore such Remedies are to be chosen as are restraining, repercussive, or resolving, according to the different dispositions required.

I know some Women who hold it for a very great secret, and most certain and sit to drive the Milk effectually back; and that is to put on her Husbands shift yet warm, immediately after he had taken it off, and wear it until the Milk be gone: but in case the Milk doth in the mean time vanish, 'tis superstitious to believe that this Shirt is the cause of it, and that it can produce such an

effect ;

Lib. III.

and

lu n,

ate

Floc

bur 9

othe and

effect; it happens rather, because all the Humours of the Body of their own accord taking another course than to the Breasts, do not daily flow in fo great abundance to them : Wherefore in the ufe of all these Remedies, the principal must not be forgotten, which is, to take care that they tend downwards, procuring to that pur-

* Cleansings. pose a good & ampleEvacuation of the * Lochia, which is much furthered by keeping the Belly open by Clyffers provoking them, in doing wherefore the Milk will

foon vanish.

All that we have faid in the former Chapters of this Third Book, is only to be observed when the new-laid Woman hath no manner of Indiffofition, for in case that any happen, she must be governed in another manner, and according as the Accidents require, of which we intend now to treat in the following Chapters:

CHAP. V.

Of several Diseases and Symptomes which happen to a Woman new laid, and first of Flooding.

TE have elfewhere mentioned the Flooding which precedes Labour, and shewed the only means to remedy it, which is to deliver the Woman affoor as possible; let us now fee whatis fit to be done to that which happens immediately or in a little time after, proceeding from the late opening of the crifices of the Vellels of the Womb AL CHIL

by the loofening of the Secondine which cleaved to it; this Blood flows then fo much more abundantly, by how much it is subtiler and hotter, or by the agitation of a long and hard Labour, and belies when a Woman is Sangnine or Plethorick.

This Accident may often happen by a too fedden or violent pulling away of the After-burden, and sometimes from some part of it being left behind in the Womb, or else some false Conception; which then endeavouring to expel, it prefies and forceth forth the Blood out of the Veilels newly mened, and fometimes a great Clod of Blood remining in the bottom of the Womb will produce the fame effect, which by reason of the distention often causes, excites Pains like to those a Woman endures before Labour, and doth not cease ormenting her, until the hath voided it, and hen he is at eafe; but fometimes the Blood coniming ftill to flow, and remaining in the bottom f the Womb, becomes new Clods; which is the ranfe why the Accident renews again as before, and continueth fo by fits, in the intervals of which there comes away fome Serolities of the lood retained, which diffolves; and makes fome erions ignorant of the Art, to think that the fox is ftopt, altho it still continues flowing withn, where it stops only by some Blood so coaguated; but when this Clod comes away, the looding begins again, pure Blood and in great buildance.

Flooding is a more dangerous Accident than any other which may happen to a Woman newly laid, and which dispatches her so soon, if it be in great mantity, that there is not often time to prevent it.

an

Wherefore in this case convenient Remedies must be speedily applied, as well to stop it as to turn it

back from the places whence it flows.

To which purpose tis fit to consider what causeth this Flooding, and if it be a false Conception piece of the Burden, or clodded Blood remaining behind, all diligence must be used to fetch them away, or to canfe a fpeedy expulsion of them; but if when nothing remains behind in the Womb. the Blood doth notwithstanding continue to flow. you must bleed the Woman in the Arm, not so much thereby to empty the fulness, as to make diversion; let her Body be laid equally flat, and not raised, that so the Blood may not be sent down to the lower parts; let her keep her felf very quiet, without turning from fide to fide, that fo the Humours may not be stirred, the upper part of her Belly must likewise not be swathed or boulftred, for fuch straitness augments the evil; let her Chamber be kept a little cool and let her not be too warm covered in her Bed, that fo the flooding through Heat may not be continued. All the World forbids Clysters in this case, lest, as they fay, the Humours be drawn down in great abundance; but I have twice experimentally found the contrary, where great Floodings have been flopt by Clysters, of which I will give you a particular account, that so it may be useful on the like occasion.

I was three Years fince called to a Woman, who was furprized with a very great Flooding immediatly after the Midwife had delivered her, which the had done with too much violence, as the good Woman affured mes who told me She felt a very Wineres

great

n gant of to

great pain at the instant she pull'd away the Afterbirth, and that the perceived at the loofening of it a crack: Now from the moment that the was fo delivered, the loft, for five or fix days continually, fo great abundance of Blood, that I could scarce believe she could, without dying, had I not feen it my felf: during, all this time they to no putpose used all the means they could imagine to stop this accident, and because with it she complained of great pains in her Belly, they gave her Anodyne and cooling Clysters, for fear lest giving her others more strong, the Flooding would be more and more excited: She had thus taken four or five Clyfters, which came away as they were given, without any Excrement; which feeing, and judging that affuredly fome gross Excrements (being retained in the Intellines from before the time of her Labour, which could not be evacuated by these Anodyne Clysters) did cause so great a Chollick, which she felt all over her Belly, which appeared puft up; I caused her to take one common and one prety strong Clyster, contrary however to the opinion of most Persons, who not knowing the cause of the Distemper, bade me have a care lest it should, as they faid, cause a greater flooding : but the issue of it was quite otherwise than they expected; for the good Woman voided with this Clyster a Pan full of gross Execrements, which having staid therea long time, and being thereby hardened, had stopt the Passage of much Wind, which paffed away at this time, Now the Intellines full of this gross Matter, being every moment agitated by this Wind, did likewise agitate and continually compress the Womb, by means of which

which the Flooding was always maintained, which did cease immediatly after this Chollick was diffipated by the evacuation of these Excrements; and fince that time being again called upon the like occasion of loss of Blood, proceeding from the fame cause, and having taken the same course, the iffue of it was likewife the fame. Wherefore if there be the least appearance of Excrements contained in the Intestines, make no scruple to give Clysters to evacuate them, forbearing in this case those that are Astringent, because they harden and retain yet more that which augments the Diftemper.

But if notwithstanding all this, the Blood flows continually, then the last Remedies must be tried, which is to lay the Woman upon fresh Straw, with a fingle Cloth upon it, and no Quilt, that fo her Reins may not be heated, applying a-

Water.

long her Loins Clothes wet in * Vinegar and cool * Oxycrate, provided it be not in the Winter, for then it must be a little warmed: by

this refreshing, the impetuolity of the Blood will be a little flop'd, and the heat of it qualified, as also by this means, that little of it which remains in the Woman's Body shall be concentred towards the principal part; and to the end her strength may be preferved, which is extreamly wasted by the evacuation of this treasure of Life, let her take every half hour a little good ftrong Broath, with a few Spoonfulls of Jelly, and between whiles the Yolk of a new-laid Egg, without giving her too much food at a time, because her Stomach cannot digest it; and let her drink be red Wine,

0

with a little Water wherein Iron hath been quenched: but if, notwithstanding all this, the Blood continues shooding, then the Woman will have often Fainting-fits, and be in great danger of loing her life; because one cannot apply in those places the Remedies fit to stop the opening of the Vellels as we can in another.

e

These three Figures represent Several Pessaries six for the supporting and keeping up of the Womb, that it may not fall out, as it doth in a hearing down, or forth of the Body.

The P. VI. and with the

Of the bearing down, and falling out of the Womb, and Fundament of a Woman new laid,

I Shall the better to explain the thing, make two I forts of Bearings down or Relaxations, as also two forts of Fallings forth, or Precipitations of the Womb; all which differ but in the degree, according as they fall down more on less: for the Relaxation is, when the Womb only bears down and comes not forth; and the Precipitation is, when it comes out of the Body.

The first fort of Bearing down, is that in which the whole Body of the Womb falls into the Vagina, in such manner, that putting up the Finger, one may feel the Orifice very near. The second fort of Bearing down is, when the Womb being yet V 3 lower,

U

10

fo

fu

W

aú

be

lo

clo of

the

(a tal

nf

Ch

12

WE

lower, one can manifestly perceive this Orifice quite without 115 Thomas Interview

The Falling out is also of two forts; in the first the Womb comes quite forth, but is not turned infide out, nor can the infide of it be feen but only its Orifice, which appears at the end of a great fleshy mass, which makes the Body of the Womb; and this is called Prolapfus Vteri, that is, a falling forth of the Womb. And the other falling out, of all is most dangerous, and is called Perversio, or turning inside out; for then it is not only fallen forth, but the bottom of it is turned quite out, that so you may perceive it all even, and without an Orifice, because it is so turned. The Womb turned on this falhion, appears to be only a great piece of bloody flesh, (and almost like the | Scrotum) which hangs

A Man's Cod. between the Woman's Thighs; and that which is wonderful in

this case is, that the Infant's House, which is the Womb, goes forth at the Gate, which is the in-A toured Bearings down or Relaxa, softino asig

The Bearing down of the Womb proceeds either from a Relaxation or Ruption of the Ligaments. Women that have abundance of the Whites, are Subject to these Relaxations, and the Ligaments are extended or broken by hard and violent La as are extended or broken by hard and violent Labour, as also by too frequent bearing of great and heavy Children, fometimes by a great Cough, by W forong and frequent fneezings, or having leaped or Bel fallen from high places, by going in a Coach, Cart, low on Horfe-back, or in other rude and shaking Carried riages; by having lifted up beyond their strength as heavy burthens, by lifting up the Arms too much, and

forts

and putting them over the Head; by a tedious Loofeness, with great Pains and Needing; forafmuch as all these things do shake and extreamly thrust the Womb downwards when it is with Child, and the Ligaments being by this means loofened or broken cannot keep it up any longer, which is the cause that a bearing down doth eastfollow the Birth of a Child : but the most ordinary cause of these Bearings down, or fallings out of the Womb, is violent and hard Travails. which usually happens when a Child comes wrong, to that it cannot be born, and when it hath too big a Head, or when the inner Orifice is not dilated fufficiently to give it pallage at that time; for the Womb is then forced down with fo much violence, and vet the Child cannot advance into the Pallage, because the Ligaments are extreamly rent or ofened, and likewife when the Secondine cleaving dosely to the bottom the Womb is pulled away of a fudden, or with too much violence, and much the fooner; if that putting up the Hand into it (as it is necessary when the String is broke) one akes hold and pulls the Body of the Womb it felf, inflead of the After-birth. We have, in the 13th chapter of the Second Book, givhn fuch Directions is swill prevent this mistake, and bring it away a- lafely 1 200 mov

forts of Women from any of the Caufes above mentioned in but a falling out but feldom, and perfect Perversion never but upon a Delivery on immediately after; because then the inner Orifice is almost as wide as the bottom of it; which is not fo at other times, when being closed, there is m polibility for it to be thus threed infide out. have shown in the 16th Chapter of the Second Book how to prevent this Accident at the time of La bour in a Woman that is Subject to it; to which place you may have recourse to avoid repetition.

If a speedy remedy be applied to the Relaxanon and falling out of the Womb, by reducing and remitting it into its natural place, a Cure may be easily expected; and so much the rather, by how much the Woman is young, and the Malada fresh: but if she be old, and this Disease be already of a long standing, she is so much the more incu-

rable.

For the Cure of this diftemper regard must be had to two things; the first is, to reduce the Womb into its natural place; and the fecond is to

lofely to the battom the

ftrengthen it, and keep it there. of bandloll

For the execution of the first, which is to reduce it, if the Womb be quite out, or turned, the Woman must first of all be made to render he Urine, and a Clyster must be given her, if it be necessary, to empty the gross Excraments that are in the Rectum, that so the Reduction may be the easier performed; then place her on her Back with her Hips raised a little higher than her Head and then foment all that is fallen forth with a little Wine and Water luke-warm, and having taken foft Rag, put it up into its proper place, thrustin it back, por all at once. Sur wagging it by little and little from fide to lide, and in cale this be too mainful, the crarie it is already too big, and Twelled moint it with Oyl of fweet Almonds, for the more enfe reduction of it, being careful afloon as it is reduced to wipe offiche Oil as much as may be to avoid a Relaptes it But if norwithstanding all this the Wombicannot be put upo because it is very much enhamed and tumefied, which happens when is hard been a long time for without the afe of necellary oneans, doring which sime it is continuedly moiltened With thring and lother Excrements. which contribute very much to its Corruption in this cafe there are great danger that it will gangrene, and be afterwards the death of the Wolfish There have however former Women efcaped this Accident a flarens recites the History of offiction one, which Ranffer doth also amongst his Cafavounbirths; but this happens very rarely. and shent

As to the second part of this Cure which domines in the retention of the World in its place, and the threngthening of it to reduced; it will be done by a convenient scitnation. Det the Woman for this purpose keep her felf in Bed on her Back, having her Hips a little raised, her Jugs formething croffed. and her Thighs joined together, to prevent the falling of it out again; but the best way is to but up a Peffary into the Neck of the Words to keep it firm; There are two are three forts made for this purpose, the several Figures of which are at the beginning of this Chapter. Some are round and a little lougish, of the figure of an Egg, and of the length and bigness of the Neck of the Womb, where it must be left after that it is introduced

ICE

ttl

in

duced into it; but these are often subject to fall out again, and are not folufeful and convenient as the other, which are made of a piece of Cork, that they may be light. They ought to be of a thick circular figure, like to a small wreath, and pierced with a pretty big hole in the middle, which ferves as well for the lodging, fupporting and receiving of the inner Orifice of the Womb, as for the giving passage to the superfluous .Humours, which are thence evacuated. These kind of Pessaries must be covered with white Wax, that they may be more smooth and incapable of hurting the Woman that uleth them : they must be pretty large, that they may be the easier kept when they are put up : they may also have a small String fastened to them, to mull them out at anytime to clean : But this String is not To very necessary, because they may be easily enough taken out with one Fingers they may be made fome of them exactly round; and others fomething of a fquare Figure, or triangular : the corners must be rounded or blunted. These sometimes hold better, and fall not fo eafily forth as the round; but either the one or the other may be used as shall be thought most fit.

During the flowing of the Lochia from the Womb, nothing else must be used to strengthen, but only to keep it so in its natural place; for astringent Remedies, proper for the prevention of the Relaxation of it, will very much prejudice the Woman, by stopping of these Evacuations; and above all it must be observed in this distemper, that the Womans Belly be not strait swathed any more than for a stay only, in which many Midwives are deceived, believing they keep it the better in its place,

place by how much they swath the Belly the straiter, for by this strong compression of it they force the Womb yet more down. She must use the Bedpan in Bed, and lying along, if possible, when she goes to Stool, keeping her hand all the while on the bottom of her Belly, to bear it up. But when the time of her Purgation is sully over, and that she hath cleansed very well, altringent Injections may be then used without danger; respect must likewise be had to the whole habit of the Body, to dry up the Humours by an universal course; and the Woman must not rise out of her Bed in at least five or six Weecks time, that so the Womb and its Ligaments may be restored and fortified in their natural Scituation.

It happens also sometimes that by the great Throws the Woman endures at her Labour, the Fundament falls quite out; in this case, if the Child be very forward in the Pallage, 'twill be sufficient before this accident happens to hinder it if possible, perswading the Woman not to help her Throwes fo frongly; but if it be already fallen down they must stay till the Child be born ere it can be put up; for before that, it will be difficult to do without much bruising the Intestine. Assoon then as the Woman is delivered, let it be reduced in the same manner as that of the Womb, after having fomented, bathed and anointed it, if necellary, forbearing afterwards during her Childbed the giving of her Clysters, because the force he useth in rendring of them, will again cause the falling down of the Fundament

and god nito Coff A P gwill along total

With a sectionere down. She mult use the Bed-Of the bruifes and neuts of the outward part of the Womb canted by Labour.

T is no wonder that often, and especially in first Labours, there happens Bruiles and Rents in the lower parts of a Woman; the cause of which is easily known, if the bigness of the Child's Head be but confidered, which must needs make a great differtion of those strait parts, by passing and coming forth of the Womb; which parts, being thereby extreamly pressed against the hardness of the Bones, that furround it are easily bruised and when they are not able to be fufficiently dilated, they must necessarily be torn afundery at aworn?

Almost all Women in their first Labours do very much complain when the Child is in the Pallage, that the Midwives prick and scratch those parts. and do believe that the hurts and bruifes which are there, after Labour, do happen because the Midwives handled them too roughly: but they are very much militaken, for this comes because the Childs-Head in passing makes a violent diffention and separation of the four Caruneles and other adjacent parts which are bringed, and fometimes rent by it , from hence foring the pains of which they then complain, as if they were pricked and fcratched, whereof they are never after fensible in their following Labours, because those parts having once given way to an Infant, are ever after very easily relaxed and extended, and every Travail with less Pain than other.

Thefe

These Contusions and Rents must never be neglected, left they degenerate into malignant UIers; for the Heat and Moisture of these parts, besides the filth which continually slows thence, doth eafily contribute towards it, if convenient Remedies be not timely applied: Wherefore affoon as a Woman is laid, if there be only simple Contusions and Excoriations, apply the Cataplasm, formerly directed, to those lower parts to ease pain, made of the Yolks and Whites of newlaid Eggs and Oyl of Roses, seeth'd a little over warm Embers, continually stirring it till it be equally mixt, and then spread upon fine Cloth; is must be applied very warm to the bearing-place for five or fix hours; when, being taken away, lay some fine Rags dipt in Oyl of St. John's wort on each fide the bearing place, and renewing them twice or thrice a day, foment these parts with Barley Water and Honey of Kofes, to cleanfe them from the Excrements which pass; and when the Woman makes Water, let them be defended with fine Rags, to hinder the Urine from cauling forting and pain by touching them.

Sometimes the Bruises are so great, that the Bearing-place is inflamed, and a very considerable Abscess follows, which I have met with; in which case it must be opened just below the swelling, in the most convenient place; and after the matter is evacuated, a detersive injection must be injected into the Cavity, with the same Fomentation above-mentioned, viz. Barley-water and Oyl of Roses, which may be a little heightned with Spirit of Wine, if here be any danger of Corruption; and aftewards

the Ulcer must be dressed according to Art.

Wit

But fometimes it happens by an unjuckly and deplorable Accident, that the Perinaum is rent, for that the Privity and Fundament is all in one. Ifin were fo let alone without re-union, the Woman afterwards happening to be with Child would indeed be delivered with more eafe, and without danger of fuffering the same again, as is usual when healed after such an accident; but if it remains in this manner, 'tis fo great an inconvenience, that her Ordure comes both ways. Wherefore having cleanfed the Womb, from fuch Excraments as may be there, with red Wine, let it be strongly stitched together with three or four stitches or more, according to the length of the separation, and taking at each stitch good hold of the Flesh, that so it may not break out, and then drefs it with an agglutinative Balm, fuch as is Linimentum Arcei, or the like, clapping a Plaister on, and some Linnen above it, to prevent as much as may be the falling of the Urine and other Excrements upon it; because their acrimony would make it fmart, and put it to pain! and, that these parts may close together with more ease, let the Woman keep her Thighs close together, without the least spreading, untill the cure be perfected. But if afterwards the happen to be with Child, she will be obliged, to prevent the like mischief, to anoint those parts with emollient Oyl and Ointments; and when she is in Labour, she must forbear helping her Throws too strongly at once, but leave Nature to perform it by degrees, together with the help of a Midwife well instructed in her Art, who being warned by the first difgrace, will do her best to avoid a second : for usually when these parts have been once rent, it is very difficult

to prevent the like in the following Travail; because the Scar there made doth straighten the parts yet more; wherefore it were to be wished for greater security against the like Accident, that the Woman should have no more Children.

Now if by neglecting such a Rent, the Lips of it be cicratriced, and the Cure be then desired, you must with a good pair of Scissers cut off those Scars in the same manner as is done in a Hare-lip, and it must afterwards be drest accoordingly, or as if it newly happened.

CHAP. VIII.

Of after-Pains which happen to a Woman newlaid, and of their several Causes.

The most common accident that usually troubles most Women during their lying in, is after-Pains.

We have formerly shewed how they are accuflomed to be prevented in giving the Woman immediately after she is laid two Ounces of Oyl of
sweet Almonds, drawn without Fire, with as much
Syrup of Maiden-hair; but since notwithstanding
this Remedy the Woman is much pained in her
Belly, let us enquire what may be the cause of all
these Gripes, which are usually called, without diflinction, After-Pains, and are sometimes felt about
the Reins, Loins, and Groins, sometimes in the
Womb only, and sometimes about the Navel and
all over the Belly, either continually, or by fits
with some Remission, in a certain place, or sometimes

at

d

to

times on and fide and fometimes on another ; all which Reflections teach exactly their feveral Caufes and accordingly the Remedies must be cater lothricy against the like Accident, theire

The Pains of the Belly for the most part proteed iffom one only of these four causes, or several of their together; the first is by Wind contained in the Bowelst by which they are early filled after kabour, as well because they have more room to dilate them when the Child was in the Womb, by which they were comprest, as also because the nourishment and matter contained as well in them as in the Stomach, have been fo confused and agitated from fide to fide, during the pains of Labour, by the frequent Throws which always much compress the Belly, that they could not be well digested, whence this wind is afterwards generated, and confequently the Gripes which the Woman feels running in her Belly from fide to fide, according as the Wind moves more or less, and sometimes alfo towards the Womb, because of the compression and commotion which the Bowels make, being extreamly thereby agitated.

The Second Cause of these Gripes which torments the Woman as much as the former, is that which proceeds from fome strange Body resting in the Womb after Labour, which it endeavours are to expel by continual Throws, and it is sometimes with a false Conception, or a piece of the Burthen, and him wery often clodded Blood which causes this tor-ment, and never ceases till what is so contain-ed in the Womb be come away: these Pains are very like the same that a Woman endures before the the is delivered, and me not abated by Clysters, a of A

thole

* Lochia, which abundantly : * Childhed cleanfing.

filing the whole inbitance of the war dealers and the property of the state of the

the Womb; causeth a great distention, and by its long stay an Inslammation, which is communicated by means of the Peritonaum to all the parts of the lower Belly, by reason whereof it swells, and is extended, and grows extreamly hard, which accident continuing, very often kills the Woman in a short time after.

The Fourth and last cause of these Pains, is the greatextention of the Ligaments of the Womb, by reason of a hard Labour; here they remain more fix about the Reins, Loins and Groins than any other part; because they are the places where these Ligaments are fastened; however these Pains to sometime communicate themselves by contimity to the whole Womb, and the rather when thath been bruised by a violent Labour.

Tis commonly held, that a Woman is not trouled with these Pains so much of her first Child, sof the following; but daily experience confirms s, that it happens indifferently, according as the resent and various dispositions contribute to it,

ither more or less, there being no certain Rules arespect either to first or last Labours.

0-

06

All these Pains must be cured according to their several causes, and to prevent those which we say reexcited by wind, give the Woman immediately after Delivery, Oyl of sweet Almonds, and Syrup of Maiden-hair mixt together; some do more

effects Oyl of Walnuts, provided it may be made of good Nuts, but this bath a worfe taffe than the other. This Remedy ferves to lenify and line the infide of the Intestines with its Unchyoufness, by meanes whereof that which is contained within them paffeth away the cafer; but, as we have faid elfewhere, this mixture is fo naufeons, that it doth often for that reason more hurt than good: wherefore I prefer a good warm Broth for those who have an averion to the Oyl. Others give half a glass of good Hippocras, but that (in the condition the Woman is in) may do more hurt, by caufing a Fever. Now for the better preventing these kind of Pains, let the Woman keep her Belly very hot, and be careful not to drink her Drink too cold; and if they tormen her very much, hor Clothes from time to time must be daid on her Belly, on a Pan-cake fryed with Walnut-Oyl may be applied to it, without Iwathing her Belly tooutrait and for the better evacuating the wind out of the Inteltines, give hera Clyster, which may be repeated as often as neceffity requires in but if by this means the pains of the Belly are now appealed, 'tis certain they are maintained by fome other caufe niwolfol all los

ed in the Womb, the expulsion of it wint be protured, or it must be fetch'd away by putting the Fingers into the Entry of it, according to the direction aheady given for the extracting of a falle Conception; and if it be great Clock which (retained) do also cause these Rains, they will not full to cease also on as they are seath away; but also the same accident will return, if new Blood flows flows into the cavity of the Womb, and coagulates there again, as it often happens; for it cannot endure to keep any thing in its capacity after the Child's Birth.

If the Woman's Cleanings be suddenly stopt, which a little before came down in great abundance, you need not search for any other cause of the pains she endures; and the speediest remedy is to bring them down, which is effected by Clysters that draw downwards, by hot and aperitive Fomentations to the bearing-place, and by bleeding in the Foot, preceded by that of the firm, if the case require it.

As to the Pains the Woman feels in her Loins and Groins, which come by reason of the greater diffention, or in part ruption of the Ligaments of the Womb thereabours fast-

ned, * rest alone, and a good * A Plaister to the stituation of the Body, will Loins is of great he sufficient to fortify and Efficacy.

re-unite them without greater Medicines, because they cannot be actually applied to the part affected, always observing a good Diet; and not forgetting, in all these several forts of pains, to provide for the natural evacuation of the Lochia, for 'tis one of the principal means to obtain a good Issue.

- tes it for A A Con to to it carsome in its capacity after

into the tayler of the Wonds and reague

Of the Lochia which flow from the Womb in Child-bed. Whence they come, and the Signs when they are good or bade uo

Do not find that Authors have fo fufficiently enquired into the cause of the Lockia, which are evacuated in Child-bed, as to make us truly understand what they are, either in respect of their Nature, affirming it to be the Blood usually purged away every Month before they were with Child, which being collected about the Womb, flows away when it opens after the Birth of the Child; or in respect of the quantity of this Evacuation, and the length of time it ought to continue. Hippocrates in his Book, De Natura Pueri, would have at the beginning an Hemine and an half a day; of which measure, though common in his time, we have no certain knowledg; for some will have it to be our half Pint, others a Pint or thereabouts, and that they continue for a Male-child thirty days, for a Female fourty, diminishing every day by little and little, until there comes no more, and the evacuation is compleated. Galen fays that these Lochia are only vitious humours, and the residue and superfluity of the Blood with which the Child was nourished in the Mothers Womb. But I will, as near as I can, here describe to you the manner how I conceive this evacuation to be made, and the reafon why they diminish day by day, and change their

their colour, confiftence and quality according to

Affoon as the Child is born, there flows away from the Womb, at the fame moment fome waterish humours, besides those which came away before at the breaking of the Membranes. Thefe Waters then are very often bloody, not that they are fo by Nature, but because there is for the most part Blood mixed with them, which comming from the Vellels of the Womb, because of the agitation and commotion they received in the Birth, become fo reddish; but immediately after the Burthen is compleatly loofened, then pure Blood flows away; and the reason why these Lochia flow freely, and are very red the first day, is because the Vessels against which the Burthen was fastened in the Womb are but newly opened; but the Blood flowing by little and little in less abundance, becanse the greatest plenitude hath been at first evacuated, doth clod in small drops on the extremities of all those Vellels whereby they are stop'd, and then there comes away only the most ferofe part of it; and therefore the Lochia begin the second and third day to be more pale and less coloured, and after that the colour of them is less bloody every day, as the Vessels close, until they are at length very pale; which happens when the Veffels being almost perfectly re-united, there distils only the meer moisture of them, as also of the whole substance of the Womb, through which a quantity of itdoth likewise transude. Now these serose Humidities acquire by the heat of these places a confiltence fomewhat thick, and that more or less, according as they come away in greater or leffer quantity,

El

ti

P

et fo

th

quantity, and according to the length of time they flay there. And then the Lochiado almost refemble, in colour and confiftence, troubled Milk, which makes the World believe it is Breaft-Milk which is in that manner emptied downwards; but in truth it is an Abuse as great as common.

For my part I know no other cause of this ordinary change of the colour and confiftence of the Lachia, nor of the diminution of their quantity. than that which we daily find in the Suppuration of a great wound fomewhat incarnated : for alloon as the wound is first made, it bleeds fresh, and in good large quantity, because the Vessels are then open; but a little after, during the first and second days, it yields only bloody Scrolities; foralmuch as some small portions of the Blood being clodded about the Mouths of the Vellels, do in part flop ed some them, and afterwards stopping them

* Matter more, it yields a white * Pus, which proceeding from the moisture, sweats through the substance of the Flesh, and of these Veffels which have been but newly closed, acquires thick and whitish consistence by the hear of the parts, and the stay it makes there. Now the better to conceive this by a comparison, you mult imagine that there is a kind of a wound made by the loofening of the Burthen from the Womb, by reason of which there happens, if it may be so faid, a kind of Suppuration, the Pm, and Excretions of which are the Lochia.

They which believe that when the Lochia are pale, it is the Milk of the Breafts which flows by the Womb, judg so, because the Milk usually abates in proportion to this evacuation, and fay be-

fides.

fides, that by the Colour and Confiltency it must needs be Milk : but if they were acquainted with Anatomy, they would know that there was no pellage which hath to this purpole a communication from the Breaks to the Womb, unless they think it is done by the means of this

imaginary * Anastome (is of * The communicatithe & Machillary Veins with on of Veins without the | Epithoferick; which can Arteries, whereby not possibly be, because not they help one another. ther of them have any ten- + Belonging to the dency cither to the Breafts Breafts. or the Worth, as Anatomy | Belonging to the makes manifest; for the Ma- Flanks. millar comes from the Sub-

devicular under the Sternum without yielding any for to the Breafts, nor fo much as touching them, and the Epigafrick arifeth from the Hiacks, without having the least communication with the Words war

Lagrencine, who knew very well it was for this reason impossible Milk should pass from the Breasts to the Womb by this pallage, finds out another way, which is as far from the truth as the first. Hisopinion (as he faith) is that the Milk and Blood how back from the Veins of the Thorax, which bedew the Breast to the Axillary Veins, and from thence to the Trunk of the Vena-cava, by the contimity of which they flow down into the Hypogafrick Branch, and from thence finally into the Womb: but besides, that it would be very difficult for the Milk, after fo long a way to come forth without being perfectly mixed with Blood; the Circulation of the Blood, which he knew not.

t

9

1

t

1

thews us plainly that it is impossible, because it doth mount back by the lower parts of the Body from the Vena-cava to the Heart, without a polibility of carrying any thing into the Womb: whence it appears that he is as far as others from

informing us how it can be done.

For my part I believe with much more reason. and I think that it is not Breast-Milk which is thus evacuated by the Locbia, but this abundance and fuperfluous Humidity which distils from and tranfudes the Veffels and Substance of the Womb, as I have explained, by means of which the whole habit of Body being much emptied, there remains not fufficient to be carried to the Breafts, and little or none flowing to them; that which is contained in them is diffipated by transpiration, and digested by the natural heat of the parts : Now the Milk by this evacuation is dried up, just as we see a Pond is that one would drain, out of which it is not abfolutely necessary to let the water run which fills it, but it fufficeth to turn back the stream that feeds it to another place, which being done, and no more new water falling into the Pond, it will foon be dried up; as well because the water is diffipated in Vapours, as drunk in by the Earth which contains And for the fame reason when we see Milchnurses want their ordinary courses, it is because that all the redundant Humours in their Body being fent to the Breafts, and emptied by the fucking of the Infant, there remains no superfluities for matter for the Terms: and for this cause it is not necessary that the Menstrual Blood should be carried from the Womb to the Breafts, for Nurse Milk to be made of it, but it is enough that the Humours

many

Humours flow towards them, without going at all to the Womb; fo likewise it is not necessary the Breast Milk should be sent to the Womb, to be evacuted with the Lochia, it being sufficient that the Humors are drawn towards it without going to the Breasts.

We must not think, as some imagine, that the Blood flowing after Labour is bad and corrupted. and the reliques of that good which the Infant hath taken for his Nourishment, nor that it hath remained in and about those places during the whole time of being with Child: for this Blood coming immediatly out of the Vessels, opened by the separation of the Burthen from the Womb, is the very fame with all the rest of the Body, in which immediatly after Labour no great change is observed, unless it be by so much alteration as the disposition of the place from whence it proceeds may cause, and according as it flows abundantly or flowly. and as it is mixt with other impurities which are emptied at that time, or that it makes some stay in the Wombafter it is out of the Vessels: and if it had fo staid in and about the Womb, as some would have it, without Circulation, during the whole time of Pregnancy, 'tis most certain it would have putrified; even as we see the Water of a Lake, for want of agitation and motion is infected and corrupted; but there is no other superfluity nor relique of the Childs nourishment, but the gross blood with which the whole mass of the Secundine is replenished. After having considered the nature and quality of these evacuations, we say that for their quantity and time of continuance there is no certain and particular Rule; for some Women have

d

ls

ls

re

in

ns h-

ife

re-

ng for

10t

arfes

the

urs

BREE

many a long time, and others but few and of ! thort continuance, which usually happens according to the Seafon, Country and Age, according to the Temperament more or less hot, or moist, the Habit more or less replete, and according to the Vellels remaining a long or a short time open But in general this Evacuation is for the most part finished in fifteen or twenty days, and foole or later according to the circumstances lately mentioned, and indifferently the same to a Woman delivered of a Boy or a Girl; during which time the Lochia diminish in quantity from day to day, until they totally cease at the end of the same afterwards the parts remain yet fomewhat moift without any manifest evacuation, except in Wemen Subject to the Whites.

This discourse must be understood of Laboursat fall time; for after a Mischance, the less the Futu is, and the less time the Woman is gone with Child, the less ordinarily are her Evacuations.

The Signs when the Lochia are good and commendable, are, that they be fresh the three or four first days, and that they lose this bloody tincture by degrees, and become pale; that they be of an equal confiftence, without any curdled or clotted Blood; that they have no ill Scent; that they be without Acrimony, and that they flow in a mode rate quantity.

We fay that they must not be fresh but the four first days, because they will not be else the true Lochia, but a pure flux of Blood, which will be very dangerous; and that they must lose by degrees this reddish colour to become pale; this figh seacheth us, that the Vellels which have been open-

ed,

ю

t

ili

ft

rer im

war

A

ion

ext

ed, are by degrees closed again; that they be of an equal confiftence without curdled or clodded Blood: by this means we are affired that there is no mixture of any strange matter, and that they are governed and regulated by Nature, they must have no Fator, or ill fcent, and be without Acrimony; in this case we know that there is no danper of corruption or inflammation in the Womb: they must flow in a moderate quantity, that so the superfluous Humours may be evacuated: for if the Lochia flow in fo great an abundance, as to caufe fainting or Convultions, the Woman will be in danger of death, as Hippocrates in the 56th Aphorismof his seb Book assures us; Si Muliebri profinvio convulsio & animi defectiu supervenium malo est: If fays he, Faintings and Convultions follow the Lachia, it is dangerous : And he adds, in the following Aphorism; Menstruis abundantibus Morbi rumium . Gubsistentibus accidunt ab utero Morbi: If the Courses or Lothia flow too much, Diseases follow; and if they stop, Diseases happen from the Womb.

Difeales proceeding from too great abundance of the Lochia are, as we have faid in the first Aphorifm, Convultions and Syncopes, or Faintings; and they do not kill the Woman, they weaken her very much; she grows lean, she remains a long ime pale, her Legs and Thighs swell, and after-

wards the becomes Hydropick.

As to the distempers which follow the suppreson of the Lochia, we will mention them in the

ext Chapter.

ence without curdled or clodded in Xns. A AHOred that there is

Of the suppression of the Lochia, and the Ac-

Here is fo great a flux of Humours from all parts to the Womb, when a Woman is with Child, and during the commotion in her Labour. that in case there be not afterwards sufficient evacuation of them, the Woman is in great danger of very ill Accidents, and fometimes of Death it felf: because these Humours, corrupting by their flay there, will certainly cause a great inflammation; and this is the reason why the suppression of the Lochia is one of the worst and most dangerous Symptoms which can befal a Woman after Delivery, especially if they happen to be totally and fuddenly stopt, the first three or four days, which is the time when they should come down plentifully; for then follows an acute Fever, great pains in the Head, pains in the Breast, Reins, and Loins, fuffocation of the Mother, and an Inflammation which is fuddenly communicated all over the lower Belly, which becomes very much swelled and blown up; there happens also a great difficulty of Breathing, Choakings, Palpitations of the Heart, Syncopes and Faintness, Convulsions, and often Death if the suppression continue; or if the Woman escapes it, the is in danger of an Abscess in the Womb; yea, and afterwards a Cancer: or there may happen great Imposthumes in the lower Belly, which is usual, because of the nearness of the place;

The causes of the stoppage of the Lochia, proceed either from a great Loofness, because a great Evacuation that way, turns the Lochia, and makes them stop; or any strong Passions of the Mind, as great Fear, or Grief, or any Anger, or Soundings, for these things do cause the Humors to retire suddealy inwards, and by this quick motion they often cause Suffocations. Great Cold stops the Lochia, because it closes the Vessels and Pores of the Womb: the use of astringent Remedies produces the same effect, as also cold Drink; because by condenling and thickning the Humors, they hinder their easy flowing; strong and frequent agitations of the Body, by rarifying and dispersing them throughout every part, doth likewise not permit them to be evacuated by the Womb.

To bring the Lochia well down, let the Woman avoid all perturbations of Spirit which may stop them; let her lie in Bed with her Head and Breast alittle raised, keeping her self very quiet, that so the Humors may be the easier carried downwards by their natural tendency; let her observe a good Diet, somewhat hot and moist; let her rather use boiled Meats than roast: and if she be any thing seaverish, let her use Broaths only with a little selly; let her avoid all binding things; let her soils of Succory, Dogs-grass and Asparagus, with a little Aniseed and Hops, and every other time let sertake a little Syrup of Maiden-hair in a glass of this Ptysan; and above all, let her carefully shun

cold Drink : Clyfters may likewife be given her draw the Humors downwards; and her lower parts may be formented with an emolient and aper rive Decoction made with Mallows, Marth-mallon Pelisory of the Wall, Camomile, Melilor, the Room of Affaragua and Linfeed; with which Decoction the Womb may likewise be injected, and with the Herbs, being well boiled and ffrained through very course Cloth, let a Cateplasme be made with the addition of Oil of Lillies, or Hogs-greate, and applied very hot to the lower Belly: tagether with these let her Thighs and Legs be strongly ruly downwards, bathing them very hot with the same Emollient Decoction; there may be likewise apply. ed Targe Cupping-glaffes to the uppermost part of the inlide of her Thighs. It would not be muchamifs to afe an Aromatick Perfame, if it were not that it cansed a heaviness of the Head, as Him crates notes in the 28th Aphorism of the 5th Book, where he faith; Suffixus Aromatum muliebria educat: fapius vero & ad alia utilis effet, nisi Capius induceret gravitatem.

Now whilst all these things are put in practice, bleeding in the Foot or Arm, must not be forgot, according as the accidents caused by this suppression of the Luckia require: neither must we blindly follow the opinion of many Women, who believe that bleeding in the Arm in this case is very per-

nicious.

This imagination is so firmly rooted in the heads of almost all of them, that if in case a Child bed. Woman happens to die after bleeding in the Arm, they fail not absolutely to condemn that a the cause: But this their Opinion is not according

E al

to knowledg : for fometimes bleeding in the Arm is better than in the Foot; and at other times that in the Foot is more certain than bleeding in the Arm .: As for example, suppose a Woman be very full of Humors throughout the whole habit of her Body, and her Lochia be supprest, by reason of which there happens an Inflammation in her Womb, and boides a great Fever and difficulty of Breathing.

asit ordinarily arrives in these Cases.

Service State Service Fig.

fis most certain that if she were immediatly blooded in the Foot, being very Plethorick, as we have supposed, there would be so great abundance of Humors drawn down into the Womb, that the Inflammation would be thereby much augmented. and confequently all the Accidents of the Diftern per; but 'twould be much better in this cafe rather to alter the Habit, first by bleeding in the Arms and afterwards the most pressing Accident being partly diminished it will be very much to the part infe to bleed in the Foot : for by this means Namre (which was almost overcome under the burthen of these redundant Humors) being eased of some part of them, doth the more easily command and govern the rest: but on the other fide, if there be a froppage without the appearance of a great plenitude in the Body, and without any notable accident, bleeding in the Foot, if it be deffrd, may be then presently put in practice. However I think it most conveni-

ent that it should * always be preceded with bleeding in cept for reasons aone of the Arms.

to include a for femerings piceding in the Arm sent some radioce HIA Pod XI at achir raind i in the Foot a more certain than blending in the

Of the Inflammation which happens to the Womb after Delivery.

ties happens an Inflammation in her. Worth, and TEry often the stopping of the Lochia, (of which we have lately discoursed, and espes cially at the beginning of Child-bed) doth cause an Inflammation to the Womb, which is a very dangerous Difease, and the death of most of the

Women to whom it happens. Daward and he

Lis also very often caused from some hurt or bruife of the Womb by any Blow or Fall, and especially from being too rudely handled in a bad and violent Labour; or by the falling out of the Womb after Labour; or elfe because of some false Conception, or other strange Body remaining behind in its which corrupts there; and likewise because it might have been too much compressed in the beginning of the Labour by the great Swathes and Napkins wherewith the Midwives and Nurse-keepers usually swathe the Belly of a new-laid Woman, to keep it (as they fay) in its place which happens also very often when the Blood being firred and over-heated by the agitation of a rude Travail, is carried thither in too great abundance, and there stays without evacustion sound * siway: * Norman in That in

... An Inflammation of the Womb may be known by being much more swelled after Labour than is requisite, and when the Woman feels a very great heaviness in the bottom of her Belly, and that it

is swelled and blown up almost as big as before Delivery; if the have a difficulty in making Water and going to Stool; or that the perceives her pain angment when the is voiding her Excrements, because the Womb presses the right Gut upon which it is placed, and to which by its proximity it communicates the Inflammation, as well as to the Bladder a The harn then also, besides a great Fever with avery great difficulty of Breathing, a Hiccough, Vomiting, Convulsions, and in the end Death, it the Disease be not soon cured. A Woman that bath received a bruife, or any violent compress on of the Wornb, is in great danger, that after the Inflammation if the do not die of it, an Abscess will be there made, or that there will remain fome Scirhou Tumour, and it may be an incurable Cancer, which will make her lead a miserable and languishing life the rest of her days.

my be first extracting or procuring the expulsion of the Atrange things as may remain in the Word after Labour, according to the directions given in its proper place, and above all treating not the least violence, for fear the evil may be not the least violence, for fear the evil may be

thereby augmented.

The Humors may be tempered by a cooling Diet, using Food that nourishes little, wherefore set her be contented with only Broth for her nou-nihment, made of Veal or Pullet, but not too strong of the Flesh, together with cooling Herbs, such as Y Lettice.

Lettice, Pursane, Succory, Borrage, Sorrel, and the like; let her abstain from Wine, and drink Ptysan made of the roots of Succory and Dogs-gras, Barley, and Liquorish; let her keep her self very quiet in her Bed; let her not be swathed too strait, and let her Body be kept open with simple Anodine Clysters; because if there be any Acrimony in the Humors, they will cause Throws, which extreamly pains the instammed Womb; and amongst all the passions of her Mind, let her especially avoid Anger.

The redundancy of Humors may be evacuated and diverted by bleeding, which at first must be in the Arm, and not in the Foot, for the reasons given in the foregoing Chapter, reiterating it without loss of much time, for the accident is very pressing, until that the greatest part of the plenitude be a little evacuated, and the Instammation something diminished, and then bleeding in the Foot will not

be amiss, if the case require it.

It may be convenient to anoint the Belly with Unquentum refrigerans Galeni, or Oil of Roses, or Oil of sweet Almonds mixt with a little Vinegar. Injections may likewise be given into the Womb, provided they be not Restringent, lest making a greater stoppage of the Lochia, which always slow a little in this case, the Distemper be not augmented; for which reason let temperate Medicines be only used, without any manner of astriction, as Barley-water with Oil of Violets, or luke-warm Milk.

Sometimes an Inflammation of the Womb converts into an Aposthume, which yields a great quantity of Matter; there is then much danger of

corruption in that part, as well by reason of its heat and moisture, which are the principles of it, as because no proper Remedies can be applied, or eafily kept to it; fince therefore nothing elfe can be done, we must be contented with an universal Regimen and Deterfive Injections to carry off the matter, that fo the corruption be not augmented by its long fray there, which may be effected by & Decoction of Barley and Agrimony mixt with Oil of Rofes and Syrup of Wormwood, and heightned with some Spirit of Wine, if there be a great putrifaction. But if the Imposthume turns to an ulcerous Cancer, then, notwithstanding the use of any Remedies what foever, this mischievous disease will endure till death; wherefore we must be contented with Palliative Medicines, a good Dietos and in this follow the precept of Hippocrates in the 38th Aphorism of his 8th Book; Quibus occults Cancri finne, non curare melina i curati enim citina intereunt, non curati vero longini vitam trabunt. Lt is better, fays he, not to take an occult and hidden Cancer in hand, for it hastens the death of the Patient, and they which let it alone live longest. Now he means by an occult Cancer, that which breeds within the Body, and especially

very of feveral notable Errors; swhich (for want of foliair and necessary a knowledg) was slid and

Chyle to the Breaks, are not yet manifestly known, we will content our selves to explain after the following manner the cause of the Inflammation of the Breasts, which doth very often happen to Women newly delivered.

All the Blood and Humors are so heated and agitated during Travail, by the Pains and Throws of Labour, that the Breasts composed of glandulous and spongious Bodies, easily receiving in too great

t

13

19

is

1

ıt

d

is

of

d

Ó

great abundance of these Huntors which flow to them from all pairts mare Toon indamed thereby; because this Repletion doch very fensibly and mainfully diftend them: to this contributes very much the Suppression of the Lachingand an univerfal fulness of the Body. This Indamination may likewife happen by the Woman's having been too firsit laced; by fome blow received upon the Breafts; or for having lain upon them, which safly bruife them, as also for want of having given Milk to the Child : in as much as by this means the Milk, which is in great quantity in the Breaks, por being evacuated, is over-heated, and corrupts by too long flay there. But from what foever cause this Inflammation of the Breafts in a Woman new-laid may proceed, convenient Remedies must be speedily applyed, left it afterwards aposthumates; or elfe, that not suppurating, there remains a schirrhous hardness, which in time may degenerate into a Cancer a very pernicious Malady, and for the most part incurable when confirmed. Besides the danger that an Inflammation of the Breafts may be converted into thefe dangerous diftempers, there happens usually to the Woman in those parts, which are very fensible, an extream pain, which often caufeth shaking Fits, and afterwards a Fever, with fo great a burning of the whole Body, that the can scarce endure any Cloaths upon her; and when she doth never so little uncover her felf, or put her Arms out of the Bed, the hath new shaking fits, which afterwards augment the heat of her Fever: it is no great wonder that a Fever foon happens upon this occasion, because the Breasts by their nearness to the Heart do easiTy communicate their Inflammation, which some times excite Fury and Phrenzy, if the Blood be sidenly and in great abundance carried thither; as Hippocrates affures us in the 40th Aphorism of his 3th Book; Quibustang, Mudicibus ad Mamma Janguis colligiour, survem significat. If (says he) the Blood be carried to, and in great abundance collected in the Breasts, it signifies that Fury

sand Phrenzy will follow.

Now the principal and most certain means to hinder the afflux of fo great a quantity of Humors to the Breafts, and prevent the coming of an Inflammation there, is to procure a good and ample evacuation of the Lochia by the Womb. Wherefore if they are supprest, they must be provoked by the means elfewhere directed for by thise--vacuation all the Humors will take their course towards the lower parts. The whole habit of Body may be emptied by bleeding in the Arm; afterwards for a greater diversion, and the better to bring down the Lochia, bleed in the foot; during which, Topical Remedies to the Breast must not be forgot, as in the beginning, to chafe well into them Dil of Roses and Vinegar beat together, laying upon them afterwards Unquentum refrigerans Gateni, and a third part of Populion mixt with it ; or a Cataplasm made of the setlings found in a Cutden's Grinftone-Trough, Oil of Roses and a little Vinegar mixt together: if the pain continue very great, another Cataplasm may be made of the Crum of white-Bread, and Milk mixt with Oil of Roses, and the Yolks of raw Eggs, upon all thefe may be laid Compresses dipt in Vinegar and Water, or in Plantane-Water; but great care must be taken that

nif

no

that these Remedies applied to the Breast be only cooling and repressing, without any great Adstriction, for it may cause a scirrhous Tumor, which would remain a long time, and it may be a worse

Distemper.

hat

After the height of the Inflammation shall be palt, and the greatest part of the antecedent Humors evacuted and diverted, let Medicines a little resolving be used, to digest, resolve and consume the Milk which abounds in the Breasts, to prevent corruption by its stay; wherefore let them be drawn by the Child, or some other Person, or else resolved, unless that it be suppurated: It may be resolved by the application of pure Hony to the Breafts, which in this case is very effectual, or else a red Cabbadg-leaf may be anointed with it, and applyed to the Breafts, having first withered it a litle before the Fire, and all the hard Stalks and Veins taken out: do not lace the Breasts too strait. nor apply any course or rough Clothes to them lest hey may be therewith scratched and bruised. A very good Remedy for the fame is, a whole red Cabbage boiled in River water to a Pap, and then well bruifed in a wooden or marble Mortar, and pulp'd through a Sieve, which mixt with Oil of Camomile, may be applied as a Poultis to the Breasts.

In the use of all these means, let the Woman oberve a cooling Diet, not very nourishing, that too nuch Blood and Humors may not be engendered, stwhich there is already too great a quantity; she nust always keep her Body open, that the Hunors may be so much the more carried downvards, and consequently turned from the Breasts.

Y 4

During

During the whole time the Infamination continues, let her keep her Bed, lying on her Back, that the may have the more cale; for being raised, the Breasts which are gross and heavy, because of the abundance of Humors with which they are repleted, do very much pain her when they hang down; let her stir her Arms as little as may be; and after the * 14th or 15th

* Too foon unless day of her Child-bed, when upon urgent occasion. The hath sufficiently cleansed, and the Instammation is aba-

ted, and she no longer Feverish, purge her once or twice, as the case shall require, to empty the illBumors which remain in the whole habit of her
Body. If, notwithstanding all these Remedies, the
swelling of the Breast doth not go down, and that
she still feels much pain, and a great Pulsation, with
a hardness more in one place than another, it is
certain it will aposthumate there, of which we will
treat hereafter.

CHAP. XIII.

Of the Curding and Clodding of the Milk.

IN the beginning of Child-bed the Woman's Milk is not well purified, because of the great commotion her Body suffered during Labour, and it is then mixt with many other Humors; now if they are then conveyed to the Breasts in too great abundance, they cause an Inflammation treated in the fore-oing Chapter; but when the Infant hat already sucked sitteen or twenty days or more, the Milk then only without this mixture of Humors is contained

contained there, and sometimes curdles and clods. And then the Breasts, which before were soft and even, become hard, uneven and rugged, without any redness; and the distinction and separation of all the Kernels sill'd with curdled Milk, may easily be perceived. The Woman sinds a great pain there, and cannot milk them as before; she hads a shivering, especially about the middle of her Back, which seems to her like see. This shivering is usually followed by a Fever of sour and twenty Hours continuance; and sometimes less, if the clodding of the Milk do not turn to an Instammation of the Breasts, which will undoubtedly happen, if it be not emptied, or dissipated and resolved.

This Clodding of the Milk for the most part proceeds, because the Breasts are not fully drawn; either for that she hath too much Milk, or the Infant is too small and weak to suck all, or because she doth not desire to be a Nurse; for the Milk in these cases remaining in the Breasts, after Concoction, without being drawn, loseth the Sweetness and Benignity it had, and by means of the Heat that it there requires, and the too long stay it there makes, sowring, it curdles and clods; just as we see Runnet put into ordinary Milk, turneth it into Curds: this accident may likewise happen from having taken a great Cold, or keeping the Breasts not well covered.

From what soever cause this Curdling proceeds, the readiest and most certain Remedy is, speedily to draw the Breasts, until they are emptied and dried; but because the Insant being weak and small cannot draw strong enough, by reason the Woman

is not fost milcht: when the Milk is so curdled, let another Woman draw them, until the Milk comes freely, and then she may give the Child fuck: and to the end the may not afterwards breed more Milk than the Child can draw, let her use Diet that gives but little nourishment, and keep her Body always open. But when it happens that the Woman neither can nor will be a Nurse, 'tis necellary to use other means for the curing of this distemper: Then her Breasts must not be drawn; for attracting more humours, the Disease will ever recur if they be not again emptied. Wherefore 'tis necessary to prevent the coming of any more Milk into them, and to resolve and dislipate that which is there: for this purpose the plenitude of the Body must be emptied by bleeding in the Arm; and befides this evacuation, let the Humours be drawn down by strong Clysters, and bleeding in the Foot, purging also if it be necessary; and to resolve, digest and dissipate the curdled Milk, apply the Cataplasm, which we faid was proper, as that of pure Honey; or that of the four Brans boiled in a Decoction of Sage, Milk, Smallage and Fennel, mixing with it Oil of Camomile, with which Oil the Breafts may likewise be well anointed.

I have fometimes feen Women apply to their Breafts, with no small success, the Linnen-covers of Salt-butter-pots; it is a drying Remedy, and fit to foak up the moisture of these Parts, and may be used; provided the Remedies before mentioned have discuss'd the Milk: but if notwithstanding all this it cannot be dissipated nor resolved, there is great danger by its long stay there, that it will

cause an Inflammation of the Breast:

If it so happen, it may be remedied according to the Directions of the foregoing Chapter. Let us now treat of Apohumes of the Breatts, which often follow their Inflammation.

CHAP. XIV.

Of Aposthumes of the Breasts of a Woman new-laid.

There may at all times happen to Maids as well as Wives Aposthumes of the Breasts, either hot or could, the ture of which doth not suffer, as saith Guido; except that too strong Repercussives must not be used, because of their nearness to the Heart, and that the retention of the Courses, consibutes much to the breeding of them, and their provocation to their Cure, as also bleeding in the Saphana: but our Intention is only to treat of those which happen to a new-laid Woman, and ordinarily succeeds an Inslammation of the Breasts, caused by corruption of the Milk, and too great abundance of Blood and Humours conveighed thither.

After all possible endeavours have been used to cause this Inflammation to cease, whether by universal evacuation of the Body, as well by bleeding in the Arms and Foot, as the provocation of the Lochia, or also by Medicines restraining, repelling, or simply-dissolving, applied to the Breasts; if the Woman still suffers great pain there, and bath a strong Pulsation more in one place than another, where a hardness of a livid colour may also be perceived, and soft in the middle, 'tis a sign

t

e

f

that they will aposshiumate. Then the Application of all the former Topicks must be forborn, and ripening Medicines applied; it being much better to make a perfect Suppuration, than longer to use Repellers or Resolvers, lest the matter be more confirmed in driving back and unly resolving the more subtile parts, leaving the thicker behind in the Breasts, which will become scirrhous, and be very difficult to dissipate, or by its long continuance, as it often happens, may turn to a Cancer.

To suppurate the Aposthume, put an emollient and ripening Poultis upon the Brealts, fuch as that made of Mallows and Marsh-mallows with their Roots, Lilly-roots, and Linfeed braifed, boiled to a Pap, that it may be pulp'd through a Sieve, that fo no hardness may be left to have the Breats, which are then in great pain; afterwards mix a good quantity of Hogf-greafe or Bufilicon with it, and lay a little Cloth, thick foread with the fame Bafilicon, upon the place where it is likely foonest to break, and the Poultis all over it, renewing it twelve hours after, or at furthelt next day, continuing this Remedy till the Apolthane be fully It is much better to use this Cataplain, or the like, than Plaisters; for a Poultis closeth better by its foftness, and is more equally applied to the Breafts; it mollifies it also, and keeps it much more supple; befides it is easier changed and cleanfed than Plaisters, which by their sticking do very much incommode these parts.

Asson as the Aposthume is ripe, it must be opened, if it open not of it self. The time when it is fit, may be known, by the ceasing of the beating the Woman selt before in her Breasts, and

ery :

00 0

that the Pain and Fever is much diminished; and then besides, the middle of the Aposthume is a little elevated to a point, and very soft, and the contained matter may by the Finger be perceived to successful and the manual and a present

When these signs shall appear, the Aposthume must be opened in the fittest place to give iffue to this matter; being careful not to do it too foon, and before the matter is fully ripe, because of too much pain: for the Brealts are very fensible parts, and easily receive a Defluxion, because of their thin and spongious substance, interleced with an infinite number of Walfels, Wherefore it must be permitted to ripen, yet not fuffered to flagnate there too long. This Apertion may be made with a lancet, or with a grain of potential Cautery, making it large enough to evacuate fuch Clods, as are there usually met with : but it is best to use the Lancet, became there is no loss of Substance, and the Scarois not fo disfiguring as that which facceeds the Application of a Cantery.

Guedo would have this Incision made in the form of an Half-moon, to follow the round Figure of the Breast; but it is no matter of what fashion it is, provided it be in a place convenient for the imprying the matter, and that care be taken that ome great Vessels be not opened, the principal of which are towards the Arm-pits. After that all the matter and putrified clodded Milk there found the emptied, the Aposthume after the usual manner must be cleanfed and mundified, observing not to take the Tents too long not too hard, but only ery soft pledgits of Lint, without thrusting them no deep in fastening a Thread to the first, if there

there be occasion, the better to draw it out, became these Aposthumes ordinarily are hollow. If there be much Pain, dip the Boulsters in Oil of Eggs, or Basilicon mixt with a Digestive, it there remain any thing yet to Suppurate; afterwards use Detersives and Mundiflers, as Honey of Roses, or Unguentum Apostolorum, according as the case requires, laying upon it a good Planter do Mulcilaginibus, to soften that hardness

which may yet remain. Heard and to the which

Sometimes the Breafts do not aposthumate only in one place, but often each of their principal Kernels comes to Suppuration, and makes formany Apolthumes, fo that they break fometimes in five or fix places, all yielding matter; in this case you need not lay open every of these small Holes, but in will be fufficient to make one or two in the mol depending part; for all the matter (which hathan eafy Communication within from one part to ano ther, because the Breasts are spongious) will soon be emptied, and the making of one or two large Orifices in a commodious place, will quickly dry ip all the reft. But the certainest Remedy to cure an Triposthume of the Breasts after the matteris emptied, and to prevent the Orifices for being to long time fifulous, is quite to drive back the Milk according as we have taught in its place, not only of the aposthumated Breast, but of both, though both be not affected, because there always re mains Communication; by this means the Ulcer will be much fooner and eafier dried up, and for this cause the Woman's Body must be kept oper by Clyfters, if the goeth not to Stool naturally and the must be now and then purged, to evace

ate the Humours, and drive them downwards, using also a slender Diet.

CHAP. XV.

Of Excoriation and loss of the Nipples.

YEry often Women that are Nurses, and especially the first time, are subject to have their Nipples, which are endued with an exquisite sence, (because many small nervous Filaments do there terminate) chopped and excoriated: which is very painful to them, and insupportable, when notwithstanding this Indisposition they give suck to their Children, and so much the more, by how much they are hard milch'd, as it happens the first time, the Milk not yet having made way through the small Holes of the Nipples, which are not yet throughly opened, and then the Child takes more pains to fuck, than when the Breasts do almost run of themselves; and sometimes these Chops and Excoriations do so encrease by the Child's contimal fucking, that in the end it takes the Nipple quite off from the Breafts, and the Woman is no longer capable of giving fuck, and there remains fometimes an Ulcer very hard to be cured.

the

Some will instead of Desicratives use Emollients, but there must be a distinction : for Emollients are fit to preferve from fuch Fiffures; but when they are already made, Deficcatives are best: and to prevent the Woman from hurts in these parts, which are very painful, and that the Rags may not flick to them, one ought to put upon them a little Wax, or Wooden Caps, or Leaden ones, they being more Desiccative, like to those reprefented in the beginning of the Chapter, which must have feveral small Holes on the top of them, as well to give iffue to the Sanies, which proceeds from the small Ulcers, as that the Milk, which which often distils out of the Nipples, may by this

means pass away.

t

r

le

g

12-

he

to

me

If the Child hath wholly fuck'd off the Nipples, the Milk must then be quite dried away, that for the Ulcers which remain may be the fooner healed, for else one shall hardly obtain the end, and in time they may become callow and malignant: and ithe Child hath the Pox, it will be very difficult to heal those Ulcers of the Nurses Nipples, if it con-tinues sucking: wherefore the Child must be put to another, who must use Preservatives against this Malady; but if they be only small simple Ulcers in the Mouth, without any malignity, 'tis enough to or Juice of Citrous; and the better to temper these with them with Barley-water, mixt with a little Humours, which are over-heated, let the Nurse tle ake a cooling Diet, that her Milk may become of be he same temperament, and let her be blooded and perged; if it be necessary.

When the Nipples are quite loft, it is very diffiult to give a Child longer fuck; because it can

take no hold to flick the Milk, and also the fmall Holes of the Nipples are eloled up by the Ulcers. But if notwithstanding the shall delive to give flick another Woman man by degrees make her new Nipples, after the Ulcer shall be perfectly heated, whole steking with her Moath will draw them one and by this means unfloo the root of the old Wipples; or using a fit instrument of glass. foch as is figured at the beginning of this Chapter. with which the Woman her felf, may also fuck them five ore fix titles a day: and to frape them. and to preferve them, being thus drawn out, from Miking into the Breaks again; let her put upon then a finall Cap of Wood, or other matter, fuch as is above-mentioned, and doing to by degrees after the Nipples are quite form'd and unftop'd, the that again give her Child fick.

What we have hitherto writ in this third Book. shall fuffice for directions concerning a new-laid Woman, and also for the knowledg and cure of Diftempers which afually happen to them, upon which we need not further clarge; for if any other hapen than what we have mentioned, and which do not properly belong to the care of a Chirurgeon, a Physician must be fent for, to remedy them by his prudence, and according as Art requires. Let us now treat of liffants new-born, and run through the Difeases they are most subject to

CHAP. XVI.

Of sending Children new born, and first how to bind, cut, and swath the Navel-string.

TF the Infant (as we have faid before, difcourling of Deliveries) bath often need whilst he is in his Mother's Belly, of the good conduct and dexterity of a Chirurgeon, or Midwife, to deliver him and bring him happily forth out of that Dungeon, wherein he hath been a long time inclosed, their affiftance is nothing less necessary to him affoon as he is born, as well to remedy fuch indifpofitions which fometimes he brings into the World, as to defend him from many Infirmities, to which the Weakness of his Age and Tenderness of his Body renders him fubject. We have in the whole foregoing Book very particularly shown how to help him in his coming into the World, there remains now only Directions what is to be done afterwards, to this purpose we will first shew how to tye, cut and bind up the Navel-ftring.

There are some Persons who assoon as the Infant is come into the World, do bind and cut the Navel-string, before the Burthen be come away; but it is better, if possible without too long stay, to defer it until the Secondine be likewife drawn forth; for the Womb, which is extreamly wide and open after the coming forth of the Child, would be in danger of taking cold by the outward Air, during the delay made for the Ligature of the Umbilical Vessel; besides that the Orifice

Z 2

closing a little, it would afterwards be more

difficult to bring the After-binth away.

To make this Ligature as it behoveth, let the Midwife do as followeth; affoon then as all is come away from the Woman, the must immediately close up the Womb with Clouts, according to directions already given, and then carry away the Child and Burthen to the fire; having put it into a warm Bed and Blancket, let her take a brown - Thread four or five double, of a quarter of an Ell long or thereabouts, tied with a fingle knot at each of theends, to prevent their entangling, and with this thread fo accommodated (which the Midwife minufothavelin a readiness before Labour, as also a - good pair of Sciffers, that to no time may be loft) der her rie the String within an Inch of the Belly, with a double knot, and turning about the ends of thethread, let her tye two more on the other fide of the string, renevating it again, if it be necessary, for greater firety; then let her cut off the Navelitring another Inch below the Ligature, towards the After-birth, fo that there only remains but two Inches of the ftring, in the midt of which will be the knot we speak of, which must - be to Brait knit or not to fuffer a drop of Blood to fiqueez out of the Wellels, but not to strait as washing, before the Burtherows nisitson

For which reason the Thread must be pretty thick and pretty ffrait knit, it being better too strait than too loofe: for some Children have miferably loft their Lives with all their Blood before it was discovered; because the Navel-string was not well tied. Now that fo great a Mischief may not happen, great care must be taken after it is 31105

the

dity that no Blood fqueez through the safe there do, new knots must be made with the rest of the string, (which for this reason must be defra little long) to close it more exactly; this being done, wrap up the end of the String thus dur and tied three or four times about with a final Rag, dev, or diptain Oil of Rofes, if you please, othen having put another small Rag three or four double upon the Belly of the Child above the Navil, lay the String fo wrapp'd up uponit, that it may not touch the naked Belly ! on the top of all putlano. ther small Boulder, and then swath it with a line nen Swath four Fingers broad to keep it fleady, left by rowling too much, or by being continually fired from fide to fide, by the motion aforthe Belly, it comes to fall off, before the Veffels be fome pleafant reasons. bale hard up and party street off Tis very convenient, as we have faid, to lay the remaining part of the String on the upper part of the Belly, that fo, if by charice the Veffels be not fufficiently closed, the Blood may not fo foon flide away, as if it, were turned downwards; for we find fometimes this String to be fo great in fome Children, that although it were very close tied at first, yet coming afterwards to wither and dry, the Ligature is rendred loofer, by means of which 'twill afterwards easily bleed, if care be not taken. This Accident hapned lately to a poor Child, who, died the twelfth day by fuch a flux of Blood, although the Midwife protested to me, that she had tied the String very exactly; and being aftonished how that could happen : she told me, that it must affuredly be, (which indeed was the truth) because the Knot was loosened in proportion to

Z 3

CI

01

the withering of the String; wherefore to avoid fuch a Misfortune, let a new Knot be knit the first time the Child is opened, whinw) sairs on

The String thus tied, begins daily to dry away. and is feparated from the Belly at the end of the fixth or leventh day ordinarily, and fometimes fooner, but rarely longer than the eighth of ninth; it must always fall off of it felf without any provocation, left that being separated too foon, and before the Veffels are entirely closed and healed up, a flux of Blood follow, which is very dangerous, as we have faid, or least it canse an Ulcer very hard to be cured! not district the

There are fome good Goffips, who are a little superflitious in the tying of this String longer or shorter, according to the difference of the Sex, for fome pleafant reasons they give, but it is a meet abufe i for at whatfoever distance they tye the Knot either nearer or further, the half a foot from the Belly, yet it will always be separated in the very fame place, just close to the Belly, be-

w 101 : Duswicause it is a part which remains * Without life. wholly * inanimate, after the Child is come into the World!

wherefore, whether Boys and Girls, let the Knot be made at least an inch from the Belly, as we have already directed; and not nearer, left it

pain or inflame the Child's Navel OA

It will not be from the purpose to mention here a bufine s of great confequence, which is sometimes capable to kill the new-born Babe, without almost knowing the cause of it; 'tis a very bad custome Some Midwives have, before they make the Knot, they drive all the Blood out of the String into the Infant's

Infant's Belly, believing that by this means they fetch it to it felf, and strengthen it when it is weak: but 'tis no fuch matter, for alloon as thefe Vessels are never so little cooled, the Blood it contains quickly lofes its Spirits, and is half coagulated in a inffant, which is the the reason, that being driven back into the Infants Liver, it is enough to cause very great Accidents; not be-cause of its abundance, but because having quite lost its natural heat, it is afterwards foon corrupted, and changeth and spoileth the Child's Blood, with which it comes to mix. They com-monly put this ill culton in practice when the Child is weak; but this doth looner suffocate it: for if they need Blood to give them Vigour, it must be good and laudable, and not that which is half clodded, and destitue of its natural heat. Wherefore whether the Child be strong or weak, if you will not put it in danger of its Life, or at least cause him to have great Op-pressions. Pains and Gripes, forbear driving his Blood thus out of the String into the Infant's Body. Now having thus tied and cut the String, wash the Child presently all over, and swaddle it afterwards, as we shall direction mon

but the Kenna A H 3 Con as

How a new-born Babe must be washed and cleansed from the Excrements, as also how it ought to be impapped up win smading couch to cause very great A with ted follow curle of its abundance, but because having o

Then the Midwife hath ordered the Child's Navel-string, just as we have directed in the fore-going Chapter, let her presently cleanseit from the Excrements it brings with it into the World; of which some are within the Body, as the Urine in the Bladder, and the Maconion found in the Guts and others without, which are thick, whitish and viscous, proceeding from the sliminess of the Waters: there are Children fometimes fo covered all over with this, that one would fay, they were rubbed over with foft Cheefe; and certain Women, of easy belief, do really imagine it was, because they had often earen some while they were with Child, that their Infants are thus full of this thick white Excrement, which in colour and confistence is not unlike white Cheefe. Das

Let the Child then be cleanfed from all thefe Excrements with Wine and Water a little warmed, and every part of his Body where this Excrement is; as principally the Head, because of the Hair, and the folds of the Groips, and Arm-pits, and the Cods; which parts must be gently cleanfed with a foft Rag, or a foft-Spung dipt in this luke-warm Wine. If this viscous Excrement stick close, that it will not easily be wash'd off from these places, it

may

may be fetcht off with Oil of fweet Almonds, or a fittle fresh Butter melted with the Wine, and afterwards well dried off; one must also cleanse and unstop with tents of fine Rags, wet in this liquour, the Ears and Nostrils; as for the Eyes, they may be wiped with a soft dry rag, not dipt in this Wine, that it may not pain them and make them smart.

After the Child is thus washed and clensed from these impurities and Blood which comes away in the Labour, with which fometimes its whole Bodyisbefineared, all the parts of it mult be fearched to fee if there be any fault or dillocation, whether the Note be ftreight, or its Tongue tyed, whether there be no bruife or tumor of the Head, or whether the Mould be not overshotten, or whether the Scretum, in case it be a Male, be not blown up and fwelled; in short, whether it suffered any violence in any part of its Body, and whether they be well and duely shaped, that so Remedies may be used according to the nature of the indisposition discovered. But as it is not sufficient to cleanse the outfide of the Child's Body; you must above all observe, that it must discharge the Excrements retained within: wherefore examine whether the Conduits of the Urine and Stool be opened, for some have been born without having them perforated, and died for want of voiding their Excrements, because timely care was not taken of it : as to the Urine, all Children as well Males as Females, do render it as foon as they are born, especially when they feel the heat of the fire, and fometimes also the Maconion of the Guts, but nevertheless usually a little after. If the Infant doth not render it the first day, that it may not remain too

too long in his Belly, and cause very painful Gripes, put up into his Fundament a faull Suppo-fitory, to fir it up to be discharged; to this perpost a sugar'd Almond may be used, anointed over with a little boiled Honey, or elfe a finall piece of Caffile-foap, rubb'd over with fresh Butter; you may also give the Child to this purpose at the Month a little Syrup of Roles, or Violets, mixt with some Oil of fweet Almonds drawn without fire, anointing the Belly also with the same Oil, or a little fresh Butter. It may be known when the Child hath voided all its Maconion, if the Stools change from black and become pale, which is about the ferend or third day, losing by degrees this tincture in proportion to the generation of new Excrements from the Milk, which about this time mixes with the first,

As to the Maconion, which is an Excrement in colour and confiftence like to the Pulp of Cassa, found in the Child's Guts when it comes into the World, twill be enough to the purpose to examine what it is, and from whence it proceeds; wherefore without dwelling upon the different explications of Authors touching its generation, I will ingenuously give my thoughts of it; which is, that it comes from the superstuous Blood daily dischart

ged, as it doth in all Persons,

I This Hepatick and of all Ages, by means of the
Channel our Au- Hepatick Channel, which comther mentions, must ing
be the Ductus Communis, which serves only to carry
off the Bile which hath been separated from it in the
Liver, and conveyed to it by the Cystick and Biliac

Channels, and earries this Bile and no Blood to the Duode-

Daodenum, de Jejunum. There is no superfluous block in the Liver; for what the Vena Porta brings, Vena Cava carries away.

ing from the hollow of the Liver, goeth and empirish into the Intestine Duodenum, out of which is formed the Macconion, which afterwards serves to kep the Intestines of the Farm open and dilated, that so they may the better perform their office after its birth; and to make it appear that it is muly thus made, and that the superstuous Blood is continually discharged by the Hepatick Channel into the Duodenum, as I do say, there are some People of 80 Years of Age, that were never let. Blood, nor never lost any outwardly, who nevertheless do and have bred

way, they must soon be suf-

focated by its too great abundance. I know that many may answer me, that it is more credible that this discharge is made by the Branches of the Vena Porta, distributed throughout the Mesentary: but such as are acquainted with the Circulation of the Blood, know that naturally it cannot well be so, and I believe they would soon be of my opinion, if they did but well consider it; and it is not sufficient to refute me, by objecting, that if the superfluity of Blood be thus daily voided, one would always have bloody Stools; because it is not unknown that this portion of superfluous Blood, which is very small in comparison of the other Excrements proceeding from the Aliment with

give him the Break. of no seil blid and it

It were to be wished that the Mother should not give it fuck, until the 8th day of her Child-bed at foonest, if not three Weeks or a Month; that so all the Humors of her Body, being well tempered, and having recovered the agitation they received in the Travail, as also their Superfluities having been wholly purged by means of the Lochia, her Milk be thereby fo much the more purified; belides this the small holes of the Nipples not yet being fufficiently opened, a new-born Babe cannot ordinarily at first easily draw her Breasts; during that time therefore let a Woman fuck her felf.

But often poor People cannot observe so many Precautions, and fuch Mothers are obliged to give their Children fuck from the first day: and likewife others will not fuffer any but themselves to do it: in this case, let their Breasts be a little drawn by fome old Persons, or some lusty sucking Child; or they may draw them themselves with a Glass. figured like that in the beginning of Chap. 15. and afterwards they may give their Children fuck when the Milk is a little brought down; let them continue to do thus, till the Milk be easy for the new-born Child to draw.

There are some who believe that the Milk of a Woman new-laid is better at the beginning than when it is purified, and that it opens the Belly and purgeth the Maconion from the Guts; but the

Gripes,

Gripes, which this over-heated and foul Milk alfo cauleth in the Child, is much more prejudicial than the good it otherwise doth; wherefore it is best not to give it such new-milk, if possible. As to the fittest time then of giving the Breast to the new-born Babe, it must not be till after the first day, for the reasons above-given; and to make him take it, because there are some that will not in three or four days, the Nurse must milk a little into his Mouth and upon his Lips, that fo he may by degrees tafte it, then let her put the Nipple dropping into its Mouth, and Iqueeze her Breaft with her Hand when he hath fastened, that the Milk may come down the easier, and that the Infant who hath yet but fmall ftrength, may not take too much pains to draw and fuck it, doing thus by degrees, until he'is well accustomed to suck.

If the Nurse hath much Milk, she must not give

the Child any thing elfe, at wo least the first two | months; We daily fee that Beafts do Thew us, that Milk Children brought up alone is fufficient to noutiff by Hand, do comin Infant; fince that they monly thrive as well do fuckle five or fix of their as those that are young ones, and fometimes suckled. more, without their taking

any other Food for a long time after. As to the quantity of Milk a Child ought to fuck, it must be proportionable to his Age and Strength; in the beginning he must not have too much, nor too often, that his Stomach not yet accustomed to concoct it, may the better digest it; afterwards et it daily, by little and little, be augmented, unil he may take his fill: As to the time and hour it

it needs no limits, for it may be at any time, night or day, when he hath a mind; but let him have it rather little and of often, than too much at a time, that his little Stomach may the better concoct and digest it without Vomiting, as it often

doth when it cannot easily contain it.

After the Child hath suck'd Milk alone for two or three months, more or lefs, according as one finds he needs stronger nourishment, give him then Pap, made of Flower and Milk, tho but little at first, and not too thick, lest his Stomach be foon overcharged by not being used to it; or (that it may be of easier digestion) put the Meal in an earthen Pan, into an Oven as foon as the Bread is drawn stirring it often to dry it equally. Pap made of this Flower, besides that it is sooner concocted, is much better than the ordinary, which is heavier, clammier, and not fo easy of digestion; for being made with raw Flower, tis very difficult to boil it well, without confuming the best part of the Milk, leaving only the groffest part behind, and losing by the long boiling both its goodness and taste. When the Child bath taken Pap thus made, which must be but once a day, especially in the morning or twice at most, the Nurse may give it a little suck, to the end that being washed down into the Stomach, the digestion may be the better and easier made.

There are many Women who give Pap to their Children as foon as they are born, and Nurses who have little Milk ordinarily do fo, to hinder their crying as they will do when they are hungry; but fomtimes this only is enough to kill them, because of the judigestion and obstruction it causeth, which

by

by reason of its gross and viscous consistence, can hardly find passage through the Stomach and Guts, which at the beginning are but weak, and not sufficiently opened and dilated, whereby there happens to the Children great oppressions, and difficulty of Breathing, Gripes, Swellings, pains of the Belly, and often Death; wherefore do not give it the Child 'till after the first or second month at soonest, and if you forbore it three or four whole months, he would thrive the better, provided the Nurse want no Milk.

When the Child hath fucked its fill, let the Nurse lay it to rest and sleep, not in the same Bed the lies in, left unawares the overlay it; as I knew one that did and killed her Child, whether wickedly to be freed from it, or innocently, she alone knoweth: but to avoid this mischief, let her lay it in a Cradle close by the Bed-fide, and put a Mantle over the head of the Cradle to prevent the falling of dust on its Face, and that the Day-light, Sunhine, Candle, or Fire in the Chamber, may not offend it. Lay him to fleep upon his Back, with his Head a little raised upon a Pillow; and to make him fleep the fooner, let the Nurse rock him gently with an equal motion, without too great shaking; left that hindring the digestion of the Milk in his Stomach, provoke him to vomit it up, just as persons do that are at Sea; not because of the scent of the Salt-water, but the shaking and tossing of the Ship wherein they are; and as it happens to many Women only by riding in a Coach, when they are not used to it. But that you may not be forced thus to rock a Child every time you would have him fleep it is good not to use him to it at first, but let A 2 2 his

his sleep come naturally of it self. There needs no certain limited time for his rest, for he may sleep at any time, night or day, when he hath a mind to it, and ordinarily the better he is, the more he sleeps; however, if his sleep be very immoderate, it may be a little broken; to which purpose let his Nurse carry him in her Arms to the light, singing with a fost and sweet voice, shewing him some glistering thing to please his sight, and dancing him a little to awake him out of his drowsiness; for by too long sleep, the natural heat doth so retire inwards, that it is as it were buried there, by means of which all the Body, and chiefly the Brain, is so cooled, that the Infant's Senses are thereby quite dull, and their Functions languishing and stupised.

When he is in the Cradle, let it be so turned as it may be towards the Fire, the Candle, or the Chamber-window, that having the Light directly in its Face, he may not be allured to look continually on one side; for doing so often, his sight will be so perverted, that he will grow squint-eyed: Wherefore for the better security, throw some Covering over the head of the Bed, as we have said, to hinder him from seeing the light; because by this means, his sight being staied from rouling from side to side, will be the better fortissed. Let us now see how a Nurse must daily cleanse her Child

from the Excrements.

As the Young of all other Animals have their Bodies free, without the trouble of any coverings, so they easily discharge themselves of their Excrements, without being befouled; and they no sooner empty their Belly, but their Dam (if they cannot do it themselves) perceiving it, casts it forth of their

Neft,

b

n

l

t

d

it

it

d

-D

Neft, or at least rangeth it in fome one part, where It cannot hurt them : but it is not the fame with Infants, who (for being bound and swathed with Swathes and Blankets, as we are forced, to give them a strait Figure only suitable to Mankind) cannot render their Excrements but at the same time they must be befouled, and in which (because it cannot be perceived for their Clothes) they often remain, until the ill fcent of it offends the Nurses Nofe; or that the doubts its because of the Cries and Tears of the Child, which is incommoded by the Moistness and Acrimony of it; to avoid which let the Child be opened and changed, at least twice or thrice a day, and also sometimes in the night, if necessary, to cleanse him from his Excrements, and change the Bed, which ought to be well wash. ed, and not flightly, as most part of hired Nurses do, which causeth a great itching, and galleth the Child's Body, because of a certain Salt coming from the Excrements, and not easy to be dissolved when the Blanket hath once imbued it, but by putting it into a Bucking-tub. The best time to shift the Child, is immediatly after the Excrements are rendred, without fuffering him to lie longer in them, than till he awakes, if he were then afleep.

Now fince he may render them at any hour indifferently, no other time can be appointed to do it but when there is most need, that is, as often as

it is necessary to keep him always clean.

The Child must always be opened before the Fire, and his Beds and Clouts well warmed and dried, before he be put into them, lest their coldness and moisture cause a Cholick and Gripes;

th

the Nurse likewise must be careful, from time to time to put foft Rags behind the Ears and under the Arm-pits, to dry up the moisture there found. being very careful, during the first four or five days, not to make the remaining part of the Navel-string fall off too foon, and before the Veffels of it be perfectly closed. Let her likewise fee every time she opens him, whether the Navel, for want of being well tyed at first, do not bleed, or because the thread is loosened; and after the end is quite fallen off, let her still for some time fwathe the Navel, ever laying a Boulster on the top of it, until it be well cicatriced and wholly depressed, and as it were funk inwards. Besides this, let her put upon the Mould of the Head, under the Biggen, another Compress, as well to keep the Brain warm, as to defend it from outward Injuries which might easily hurt it, because of the tenderness of that place not yet covered over with any Bone; let her also be very careful not to let the Child cry too much, especially at the first, lest the Navel be forced outwards, and that there happen to him by its dilatation an Exomphale, or a rupture in the Groin; nor must she hearken to the fayings of some good People, who affirm it necessary a Child should sometimes cry to discharge its Brain: the two best ways to quiet him when he cries, is to give him fuck, and lay him clean and dry; 'tis likewise good to present to his fight things that rejoice him, and to remove what may affright or grieve him.

All these directions in this present Chapter, concerning the Diet and Order of a new-born Babe,

Habe, must be understood for one in health; for if he be any ways indisposed, he must be treated according as the case requires. This is what we intend to examine in all the remaining part of the Book.

CHAP. XIX.

Of the Indisposition of little Children, and first of their Weakness.

Young Trees are scarce raised out of the Earth, I which is their Mother, but often many of them foon after die; because their small Bodies, by reason of the tenderness of their substance, easily receive alteration, and cannot without great difficulty relist the smallest opposition, until they become a little bigger, and have taken stronger and deeper root: So likewise we see daily above half of the young Children die, before they are two or three years old; as well because of the tenderness of their Bodies, as by reason of the feebleness of their Age, they cannot otherwise express the Incommodities they suffer within, but by their cries. We have heretofore discovered how they ought to be governed in the beginning for the preservation of a good health; we will now discourse of the Indispositions to which they are subject, principally from their Birth, till they are feven or eight months old. Let us first mention some they are born with, and then we'll entertain you with those that usually happen to them afterwards. The Aa 4

The first Accident to be remedied, is a weakness many Children bring into the World with
them; which often happens, not because they
are so by Nature, but by the violence of a bad
Labour, or the length of it, during which they
suffer so much, that sometimes after they are
born they are so weak, that it is hard to be discovered whether they are dead or alive, not any
part of their Body being perceived to stir, which
sometimes is so blew and lived, especially the
Face, that one would think they were quite
choaked. And many times, after they have been
thus for whole hours, they recover, by little and
little, from their weakness, as if they revived,
and were returned from Death to Life.

One may guess that the Child is not effectually dead, altho at first it doth in some fort appear so to be; if the Woman, but a little before she was brought to Bed felt it to stir strongly; if she did not slood much, and if she had no very hard Labour: but 'tis very certain he is yet living, altho he do not cry, nor move any part of his Body after he is born; if laying the Hand upon his Breast the motion of the Heart be felt; or touching the Navel-string near the Belly, there is yet perceived a small pulsation of the Arteries: Then all forts of means must be used to recover him

out of this weakness.

Now the best help in this case is, to lay him speedily in a warm Bed and Blanket, and carry him to the fire, and there let the Midwise sup some Wine, and spout it into his Mouth, repeating it often if there be occasion; let her likewise lay Linnen, dipt in warm Wine, to the Breast and Belly;

the Face be uncovered, that he may draw breath the easier; and to be yet more helpful to him, let the Midwife keep his Month a little open, & cleanse the Nostrils with small linnen Tents, dipt in white-Wine, that so he may receive the smell of it; let her chase every part of his Body well with warm Clothes, to bring back the Blood and Spirits, which being retired inwards through Weakness, puts him in danger of being choaked: in doing thus by little and little, the Infant recovering his strength, will insensibly come to stir his Limbs one after another, and so at sirst cry but weakly, which afterwards, as he breaths more freely, will

augment and become stronger.

1

y

e f-

1-

et

Besides these helps we have mentioned, which certainly are the best and most certain for the weakness of a new-born Babe, Midwives ordinarily make use of others, which I do not approve of, not only because they are useless, but because some of them are very dangerous to the Child. Some lay the After-burthen, being very warm, to the Belly, and leave it there till it is cold. I have elsewhere declared, that the Burthen, by reason of its heat, may be something serviceable; but notwithstanding, because of its weight, being so placed upon the Child's Belly, which wanting a support, is easily compressed, it doth very much hinder his respiration, which at that time is most necessary for him. Others cast the Secondine into the Fire before it be parted, and some put it in warm Wine, believing that by this means the strength of the Wine conveighed through the Umbilical Vessels, is able to give him new vigour: But as this fleshy Mass, and these Vessels, are dead parts

n

first

cord

parts as foon as they are out of the Womb, fo there remains in them no Spirits which can be communicated to the Infant: And if this praclice be continued, it must rather be to fatisfy custom, than for any hope of benefit to be there-

by received.

If these things do no good, yet do they no great hurt, but are only useless; but this which follows is capable to fuffocate a Child immediatly, that is, when some do thrust back, and make the Blood which is in the Umbilical Vessels to enter into the Body, believing that it fortifies and recovers the Child out of its weakness; but we have elfewhere declared, that the Blood contained in these Vellels, lofe their Spirits as foon as the Secundine is separated and come forth of the Womb; nay, it is there immediatly after, half congealed: Now if it be thus thrust back into the weak Child's Liver, it remains there, being no longer animated with any Spirits, and instead of giving him new strength, it overcomes that little which remains, and compleats the extinction of his languishing natural heat: to avoid this be careful not to force back the Blood thus into the Infant's Belly, for befides in these weaknesses, (unless it should be otherways by the Mother's flooding before the was brought to Bed) there is always too much of it in the Infant's Body, and instead of sending more to it, there must be some drawn back from it towards the extremities, that so its Ventricles being a little discharged, may have afterwards a more free motion to fend back the Spirits to all parts, which are deprived of them by these faintings: Wherefore fince the Child must receive nothing from the Umbilical

Umbilical Veffels after its Birth, let them be tied as foon as may be, and then ordered according as we have directed.

Very often the Children which are weak at their Birth, are so by nature; as when they come before their time, and are so much the weaker, by how much they want to compleat the end of the 9th month, and also when they are begotten by infirm and sick Parents.

These are hard to remedy, and there is nothing more to be done, but to nourish and order them well according to our former directions; but it will be rare for them to be long-liv'd, and it is much if they do not die by the least indisposition that betalls their natural weakness.

CHAP. XX.

Of Contusions, or Bruises of the Head, and other parts of the Body of a new-born Babe.

The Bodies of new-born Children, are, as we have faid, so tender and delicate, that they are easily bruised and hurt; and sometimes in a bad Labour their Members are dislocated, either because it remained long in an unnatural posture; or because they were handled too rudely in the Operation: the most usual and frequent bruise is for the most part on the top of their Head, where sometimes at their Birth, they have a Knob as big as half an Egg, if not bigger, as is usually seen in sirft Labours; and which happens the sooner, according as the Woman is advanced in Age, because the

the inward Orifice of the Womb, called the Garland, being more callow, doth not dilate without much difficulty; for which reason, the Child's Head pressing against it, and the upper part of it (which naturally prefents first to the Passage) being begint with it as with a Garland, is puft up and swelled (because of the Blood and Humors which fall down, and are retained in this part) by the great compression which this inward Orifice makes round about, especially when the Throws begin to be strong, and the Child comes but flowly forward, after the Waters, which did a little defend it, are broke away; the Midwife also may do muchill in it, if the toucheth it too often, or too roughly with her Fingers, when it lies in the Birth; but many times they are in this case wrongfully accufed; because, for the most part, the single compression this Orifice makes in the form of a Garland about the Child's Head, is the cause of this kind of bruised Tumors.

This part swells after the same manner as we fee all others, which are either too strongly prest, bound, or lased; for by this means, the Blood which cannot circulate, being stopt in great abundance in one part, obligeth it to swell and be blown up; and, by the repletion it makes, renders it livid, as if it were bruifed: Now this compression is much greater in respect of the Veins, which are always more outward, and ought to carry back the Blood to the Heart, than of the Arteries, by means of which it is carried to all the parts; for besides that the Arteries lie deeper, they have also a continual Pulfation, by the favour of which a little Blood ever flides away; and this is the reason

that

that in all Compressions or Ligatures of parts, provided they be not too hard, the Blood is easily carried into them by the Arteries, and but very hardly, or not at all, carried back by the Veins; which is the reason that the part receiving much more than it sends back or consumes for its nourishment, must needs swell on this fashion by Repletion. If they that practise Midwifery do but well consider what I have said, when occasion offers, which is very often, they will find that these kind of Knobs or Tumors, which many Children have on their Head at their Birth, proceed ordinarily from no other cause than what I have here

explained.

These Tumors many times are so great and high, that (the Woman not being yet delivered, nor having the inner Orifice of the Womb well dilated) they do hinder the discovery of the part the Infant first presents, making Midwives sometimes to imagine, not being able to feel any Bone of the Head with their Finger, that it is the Child's Shoulder, or some other part, nay some of them cannot tell what that fwelling is they feel: but they may foon know it, by reason these Tumors, the feeling very fleshy at the touch, are notwithstanding harder than any Shoulder, or Buttock of a Child, which parts are always more foft and without Hair, as the Head hath, the Bones of which may also be eafily perceived, if having the Finger anointed with Oil or fresh Butter, it can be introduced into the inner Orifice, for the parts of the Head within the Womb, are not swelled, 'tis only this which offers to the Orifice, and is prest and begirt by it, as we have faid. If a Child comes with any other

C

D

al A

up

Ye

bra

ly

La

WH

ger

cou

cate

part besides the Head, as an Arm or a Leg, and that these parts likewise remain a long time prest in the Passage, and in a posture much constrained, or that they be come forth, they likewise swell for the same reason.

There must not only be Remedies applied to these Knobs and Bruises of young Childrens Heads, but endeavours must be to prevent them, or at least to hinder them from becoming so big: the means to prevent them, is to procure the Delivery as soon as may be, that the Infant's Head may not rest so too long, and be straitned by the Garland of the inner Orisice of the Womb, which must be well anointed with Oil, or Emollient Ointment, as well to surther its dilatation, as that the Head

may the fooner and the eafier pass.

Some may object, That if these Tumors happen from the cause I have mentioned, they would disappear as foon as the Infant is born, because then the Head being no longer prest, nothing hinders the Blood, which had tumefied the part, from returning, having its motion free: But they must know, that by its too long stay it makes in one part, it loseth the Spirits which are there suffocated; of which being destitute, it can no longer move, and being flown without the Vessels, out of its natural place, (as it will be, when the Vessels containing it are too full) it flides into all the little vacuities of the part, for which cause it cannot afterwards return by the ordinary ways; wherefore there is a necessity in this case, either that it be resolyed through the part, or if it stay any time, that it comes to Suppuration; which however must be avoided, if it be possible, because of the nearness of

of the Brain, which in Infants is not covered over with the Skull at the Surares, which are always very open, especially towards the Mould.

To resolve these Tumors then, as soon as the Child is born, foment them with warm Wine, or Aquavita, and wetting a Compress in it, put it upon them; fome Midwives only dip a Compress in Oil and Wine beat together; others in Oil of Roses only, having first fomented them with Wine: but if, notwithstanding this, they come to Suppuration, the matter must not be suffered to remain there too long, for fear left the bones of the Head (which are very tender and thin in new-born Children) become altered and foul; in this case, it must be opened with a Lancet in a proper place, according to Art, putting upon it afterwards a Plaister of Bettony; if a Leg or an Arm be thus swelled, it must likewise be wrap'd up with Compresses dipt in Wine, wherein Province-Roses, Camomile-Flowers and Melilot have been boiled.

Sometimes also Male-children have the Scrotum very much swelled, which may happen to them by reason of some Waters contained in their Man-branes; or because they were bruised, or too rudely handled by the Chirurgeon, or Midwise, in the Labour. In these cases, Compresses dipt in Wine with Roses, are very proper to both.

But the greatest mischief is, when the Chirurgeon (being either inexpert and unhandy in such an Operation, or because of a bad Labour it could not possibly be otherwise) breaks or dislocates a Leg or an Arm of the Child in extracting

of them: if it thus happens, you must afterwards help it, by putting together the parts, and keep ing them fo with fit Boulfters, or Splinters, in their natural fcituation, untill they shall be well closed and fortified.

CHAP. XXI.

Of the Mould of the Head, and of the Sutures being too open. Anwhon all my : one he matter unde norbe infractore

TEry often Children, who come before their time, not having yet acquired their full perfection, as also they which are by nature weak, have the Mould of their Head, and the Satures fo open, by the distance and separation of the Bones one from another, that it is very foft and almost without any support, because the Bones eafily yield to every fide; thefe Children are not usually long-liv'd. One must not think then to bring the Bones close together, by binding the Head strait, for this would to press the Brain, which is very tender, that it would cause a worse Malady, in taking away the liberty of its motion, whereby its Functions would be depraved, and afterwards totally abolished. It will be sufficient to bind them foftly with a small Cross-cloth, left they should be too unsteady, and commit the rest to Nature's Work, which by degrees will close up these Sutures (in finishing to ingender) and dry up and unite these Bones of the Head, which were not hitherto perfectly formed.

The place where the Sagittal Suture joins and terminates, in the middle of the Coronal, which it always in every Child divides in two, continuing to the very root of the Nofe, is called the Fountain of the Head, became * Mould, tis the foftest and moissest part of it, which for this reason is the last dried and closed

The Figure of it is represented in the Head,

placed at the beginning of this Chapter.

There are Children who have it fometimes openill they are three years old, if not longer, which sa great fign of the weakness of their natural Heat. It is usually quite closed up at the end of wo Years, and fooner or later, according as the Infant is more or less moist, or more or less strong. Until these Bones are entirely closed, 'tis convenient to lay upon that place (as we have already Mewhere directed) a Linnen Compress three or four double, to defend the Head, as well from cold, as other external injuries. Some Women ep a piece of Scarlet Cloth a long time to it. hinking that it doth strengthen the part more is no matter what one uses, provided it will keep be Brain warm, and hinder any hurt in that bace, which is not as yet covered over with any

It happens sometimes, that altho the Bones of the Head be big enough to unite in all parts, if they were not hindred, they are however extreamy distant one from the other in the place of the wines; because of the quantity of Waters contained between them and the Dura Mater: this salady is called Hydrosephale, of which there are any sorts, according as the Waters are nearer, Bb

or further from the Brain, or that they are contained within its Ventricles. When the Waters are between the Skin and the Pericranium, or between the Pericranium and the Skull; the Children may be cured of it, if the Tumor be not too great, by refolving of these Waters, or emptying them by an Incision: but if they are in great abundance, under the Bones, between them and the Dura Mater, thrusting them so outwards, and enlarging the Sutures, the Children cannot escape it; which is yet so much the more impossible, if the Waters are contained between the Dura and the Pia Mater, or within the Brain.

C H A P. XXII.

Of a new-born Babe's Fundament being closed up.

T happens fometimes that young Children, as well Male as Female, are born with the Fundament close stopt up; for which reason they cannot render nor evacuate, neither the new Excrements engendred by the Milk they fuck, not the Maconion, which was amassed in their Intestines, whilst they were in the Mother's Belly of which Disease they certainly die, if not speedily remedied. There having likewise sometimes been Girls, who, having the Fundament closed, yet voided the Excrements of the Guts by an Orifice, which Nature, to supply its defect, had made within the Vagina, or neck of the Womb.

ratiful inc

an

Ulce

Now the Fundament is closed two ways; either by a simple Membrane, as the single Skin, through which one may perceive some livid marks, proceeding from the retained Excrements; and touching it with a Finger, there is felt a softers within, whereabouts it ought to be pierced: or else it is quite stopt up by a thick sleshy subtance, and in such sort, that there appears nothing without by which its true scituation may be denoted.

When there is nothing but the fingle Skin which makes this clofure, the Operation is very eafy, and the Children may escape. Then an apertion may e made with a small Incision Knife, cross-ways other than simple or long, that it may the better receive a round form; and that the place may ot afterwards grow together, being very careal not to hurt the Sphineter of the Rectum. The heision being thus made, the Excrements will artainly have iffue: but if because of their long by in the Belly being become dry, the Infant annot void them, some small Clyster must be iven it to moisten and bring them away; after-ards put a linnen Tent into the new-made Funament, lest it close again, which must be at ist anointed with Hony of Roses, and towards the end with a drying and cicatrizing Ointment, as Unquentum Album, or Pompholia; oblerving to cleanse the Infant of his Excrements, and drefs it again as foon and as often as he tenders them, for fear lest their staying too long here, may turn the Apertion into a Malignant Ulcer.

ali

fu

do

h

to

to

do

YO wh

If the Fundament be fo ftopt up, that neither mark, nor appearance is feen on felt, then the Operation is much more difficult; and altho in be done, it is a great hazard if the Infant escapes it: wherefore if it be a Girl, which empties her Excrements by the Vagina, as it sometimes happens, 'tis better not to meddle with it, than by endeavouring to help an inconvenience, cause the Child's death; but when there is no vent for the Excrements, there is a necessity to come to the Operation, the it be very perilous, without which

death would undoubtedly follow.

To do this well, altho there be no outward marks of a fit place, because of the thickness of the flesh which is upon the Intestine, let the Chirurgeon, with a final Incision Knife that hath but one edg, enter into the void place, and turning the back of it upwards, within half a fingers breath of the Child's Rump, which is the place where he will certainly find the Intestine, let him thrust it so forward, that it may be open enough to give free vent to the matters there contained being always very careful of the Sphintter, after which let the Wound be dreffed according as we have above directed, having regard to the Accidents which may follow.

When it happens, as it is very possible, that the Urinary Passage, as well of Male as Female, is stopt up, the like Apertion must be made to give passage to the Urin contained in the Bladder, and afterwards a small leaden Pipe must be introduced into it, to keep the Passage open until the lacision there made by a Lancet be cicatrized: but as it is very difficult to have fuch a Pipe retained

he a little Boy's Yard, which because it is so hort, will admit of no proper swathing, it may be let alone, since the Urin which he renders at all hours, will hinder the Apertion from closing.

CHAP. XXIII.

Of cutting the Tongue when Tongue-tied.

He Tongue is naturally tied with a Ligament I fufficiently ffrong, fastned just underneath in the middle of it, to be instead of a support; upon which being fultained, it may make all its different motions on either fide: this Ligament ought to leave it an entire freedom, of being carried and Supported in all places of the Mouth : wherefore it mult not be fo fhort nor fo fasthed, but at a conrenient diffance from its extremity, which must eperfectly free on all fides : But often new-born labes have before it a fmall membranous produdion usually called the String, which is continued almost to the end of their Tongue, and taking away the liberty of its motion, hinders them from ficking with eafe; because the Tongue, being kept down, and, as it were, bridled with this Thread, the Infant cannot move it upwards (as it is necessary) to press the Nipple with it against the Pallat, and to fuck it to draw the Milk, neither can it move it commodiously to swallow it afterwards.

To remedy this inconvenience, you must not do as some Women do, and tear this Thread with your Nails, for that may make an Ulcer there, which afterwards would be hard to cure: but

Bb 3

carry the Child to a Chirurgeon, and he will cut as much or as little of it as he thinks needful, with sharp Sciffers, cutting at the point, being careful not to cut the proper Ligament of the Tongue, nor to open the Vellels which are under it: to do this Operation handsomly, let him heave up the Child's Tongue with one or both of his Fingers, which he must put under and on the sides of it, that he may discover what is necessary to be cut. But since new-born Children have often their Mouths fo little, that it is very difficult fo to lift up their Tongue with your Fingers, which being within the Mouth doth likewise hinder you from seeing what is fit to be done, let the Chirurgeon for this purpose make use of an Instrument, made like a small Fork, as is represented in the beginning of the .Chapter, of which let him put the two small branches (which must be blunt at the points) underneath the middle of the Tongue on each fide of the String, and then lifting it strait up, he will easily command it, by means of which he will make his Operation more commodiously and certainly.

This Instrument, because it is little, will not hinder the inspection into the Mouth, as the Fingers which are too big will do. After that the Tongue is thus dexteroully cut, the Nurse must every day twice or thrice pass her Finger, being very clean, underneath it, to prevent its growing together again, doing it very gently, for fear of irritating the small wound, that it may not beinflamed; which will be a greater hinderance to the Child's fucking, and that it turn not into an ill-

natured Ulcer.

CHAP. XXIV.

Of Gripes and Pains of the Belly of a young Child.

Any Children are fo griped, that they cannot IVA forbear crying night nor day, for the great pains they feel in their Belly, with which fome are fovext and tormented, that they die of it. very often the first and most common Distemper which happens to little Infants after their Birth; which in general, and for the most part, comes from the sudden change of their Nourishment; forafmuch as having always received it by the Umbilical Vessels, whiles they were in their Mothers Belly, they come to change it of a sudden, not only the manner of receiving it, but the nature and quality of it as foon as they are born: for instead of purified Blood only, which was conveyed to them by means of the Umbilical Vein, they are obliged, for want of it, to be nourished with their Mothers Breast-milk, which they suck with their Mouth, and from which are engendred many Excrements, causing the Gripes, as well because it is not so pure as the Blood with which it was fed in the Womb; as because the Stomach and Intestines cannot yet make a good Digestion, nor an easy Distribution, being not accustomed to it.

The particular causes of these Gripes are, either when the Maconian (amassed during all the time of Pregnancy) is not evacuated soon after

the Infant's birth, and that by its too long stay in the Intestines, it acquires a sharp and pricking Acrimony; or that becoming hard, the Infant cannot void it, nor the new Excrements which proceed from the Milk, which he hath teken at the first: 'tis also sometimes because the Child not being able to fuck with eafe, he fwallows, in fucking the Milk with difficulty, much Air and Wind, which being retained in the Stomach, and sliding into the Intestines, doth-painfully diftend them. This Wind sometimes is capfed, when a Child takes a greater quantity of Milk than he can digeft; or because of its ill quality, as when the Woman gives her Breaft-milk as foon as the is delivered, without staying to have it purified: Cold may also make it suffer the same. But very often it is by giving him Pap too soon, as also when it is not enough boiled; because this Nonrishment, which is gross and viscous, cannot be easily digested by a new-born Babe, whose Stomach is not yet accustomed to it; and Worms, that are engendred in the Intestines, by their stirring and biting, do also much torment them. Besides all these things already mentioned, the Midwife also may cause great pains in the Child's Belly, by driving back into it the cold and clodded Blood out of the Navel-string before it be tied.

Women usually call all by one common name of Gripes, respect must be had to their different causes. As to that which is the general cause, the too sudden change of the nourishment; To avoid it, one must forbear giving the Child suck, until

the

the next day, left the Milk being mixt with the Phlegm which is then in the Stomach, corrupt; and at first it must suck but little, until it be accustomed to digest it. If it be the Meconion of the Intestines, which by its long stay causeth these pains; to help to discharge them of it, give them at the Mouth a little Oil of sweet Almonds, and syrup of Roses, as we have directed before; and to provoke it further, give it Bens stalk, covered over with Hony, for a suppository; or a sugar'd Almond also dipt in common Honey; or one may

give it a fmall Clyfter.

If a Child cannot fuck with eafe, regard must be had to that which hinders it; for if it be Tongue-tied, it must be cut, as is above-directed; and if it be because the Nurse is hard mucht. change her for one whose Milk is better purified; and let her rather fuckle it a little and often than more at once than the little Stomach can easily digest at a time. And above all, whiles the Child is griped, give it no Pap; because this food, by its viscosity, doth easily cause Obstructions, which afterwards engender Wind. If it be Worms, by a Cloth, dipt in Oil of Wormwood mixt with Ox-gall, upon the Belly; or a small Cataplasm mixt with Pouders of Rue, Wormwood, Coloquint, Aloes, and the Seed of Citrons, incorporated with Ox-gall and flower of Lupines; and to draw and drive them more downwards, if the little Infant can take any thing by the Mouth, give it a small Infusion of Rhubarb, or half an Ounce of compound Syrup of Succory; having before given it a small Clyster of sugar'd Milk: for by this means the Worms, which shun the bitterness of the

B

m pa

an

m

C

Cei Ve

fla

102

the Medicines, and feek after the sweetness of the

Milk, are easily brought away by Stool.

When these Gripes are caused by Wind, as it often happens, or by any sharp Humors in the Intestines, anoint the Child's Belly all over with Oil of Violets, or with Oil of sweet Almonds, or else with Oil of Walnuts, Camomile, and Melilot mixt together, having first warm'd them, in which also a Cloth may be dipt to lay upon it; or a small Pancake may be made with an Egg or two fried in Oil of Walnuts, to be applied to it; and they may take a little Anodine or Carminative Clyster, according as the Cause of the Gripes is known; above all, ever keeping the Child very warm.

* If these Gripes encrease, give it a little Antidote or Emetick

CHAP. XXV.

Of the Inflammation, Ulceration, or shooting forth, or rupture of the Navel of a young Infant.

The continual cries of little Children, because of the Pains and Gripes which they feel at the beginning, doth sometimes cause such an agitation of the Belly, that the Navel-string falling off too soon, and before it be entirely closed and cicatrized, there happens an Inflammation and Ulceration; at other times also for the same reason, altho it be outwardly healed, not being so within

within, it is dilated and thrust outward the bigness of a small Egg, and sometimes bigger, which is usually called Exemphale; or shooting forth of the Navel.

There are some who imagine, when it is so infammed and Ulcerated, that it was because the String was tied too near the Belly, which caufed a great pain and inflammation to follow: Others fay that Nature having used to discharge the Urin by this part, during the Child's being in the Mother's Belly, doth still continue to fend it this way, and that it causeth this Accident by its Acrimony, for which there is no reason: for 'tis impossible the Urin should regorge from the Bladder to the Navel by the Urachus; forasmuch as it is not hollow inan humane Fætus, as we have elsewhere made appear. And how near the Belly foever the Navel-string is tied, and how hard (provided some of the true Skin, which is fensible, be not also tied with it) it can cause no manner of pain to the Child; because it is a dead and inanimate part as foon as a Child is born, and likewise insensible; because there is no Nerve distributed into it. But this Inflammation usually comes, as I have mentioned, because the Infant, feeling the great pains and gripes in his Belly, doth continually cry, and thereby hinders the Navel from healing: it may likewise be caused by a violent and frequent Cough, because by these efforts, the Blood is forced back into the remaining end of the Umbilical Vein, which it always keeps dilated, and being corrupted by its flay there, fails not to make an inflammation of the Navel, and that which was tied coming to fall off before it was perfectly healed, there

M

ffi

the

rej

the

ifi

the

the

there remains a very bad Ulcer, upon which fome. times follows a great loss of Blood, and it may be Death.

The principal thing to be observed in the cure of this Malady, is to appeale the Cough, and quiet the Child's crying, respecting that which causeth it, without which it would daily increase; and if it were the Gripes, it must be remedied, as is directed in the foregoing Chapter: as to the rest, if the Navel be inflammed, one must lay upon it Un. quentum refrigerans Galeni, mixt with as much Populeon; or a small Boulster dipt in Oil of Roses with a little Vinegar: Unquentum Rosatum & Album, mixt together, is also good for it. If the Navel continues ulcered, after the String is fallen off, Desiccative and Astringent Medicines must be applied to it, fuch as is small Rags dipt in Lime-water which is not too strong, or Plantane-water wherein a little Allom hath been diffolyed. If the Ulcer be small, a Pledgit of dry Lint will be sufficient. Many put to it only a little Powder of a Post. These things are better for this purpose than Plaisters, which are never fo drying, because of the Oils and Greafe which enter into their composition. But if notwithstanding one would use them, he may take Desiccativum Rubrum, or Diapompholigos; particularly observing to put a good linnen Compress on the top of these Remedies, with a Swathe to keep them fast, until the Navel be ciccatrized and perfectly healed; left besides its Ulceration, it be forced outwards, and that its Veslels open by the violence of a great Cough, or by the agitation which the Gripes cause in the Child's Belly.

he

As to the rupture of the Navel in young Children, whether great or little, the cure of it mult not be otherwise undertaken than by Swathes and Compresses fitted for the purpose, till they have acquired a more reasonable Age, when, if the Malady be not cured by the Swathes, the Operanon may be done if defired: But if after the infammation there grows an Imposthume, which carfeth the shooting forth of the Navel, and that the tumor of it be very great, then it ever kills the Children, and if it be opened, the matter indeed may be emptied, but there is great danger that together with it, the Guts come forth in the same place the first time the Child cries, which may afterwards perfuade those that understand not the Art, that this accident happened through the Chirurgeons ignorance. For this reason Ambrose Parcé in his 94th Chapter of his Book of Generation, advileth you not to meddle with it, but rather to let the Child die, without doing any thing to it, as he faith he did himself, when he was fent for by a Taylor in the like cafe.

He recites in the same place a story of a Chinurgeon of his time, called Mr. Peter de la Rock, who was in very great danger of his life, for having opened an Imposshume of the Navel of a Child of Monsieur de Martigues, which being done, the Intestines came forth by the Orifice, and soon after the Child died, which the Servants of the House reported was thereby caused, and therefore (altho without reason) they would have killed him, if the said Monsieur de Martigues had not hindered them: but I believe the Chirurgeon had shunned the danger they put him in, and that disgrace, if

he had before made a good Prognostick of what would follow, and the danger wherein the Infant was; for it may be, refembling many of our time (who undertake fuch things that they may be thought more able than others, and being but fimple Fellows, boast themselves capable to work Miracles) he had promifed speedily to cure the Child of this Malady, which was incureable, that (under so fair hopes) he might have a good sum in hand paid him. In this we must follow Pare's advice with some distinction; for, if the Imposthume be fmall, and the Child strong, one must not forbear, having first made a good Prognostick, to open it; and when there is never so little hopes, 'tis better to practife what Art commands, than to for fake the fick in a certain despair.

CHAP. XXVI.

Of the Smartings, Redness and Inflammation of the Groin, Buttocks, and Thighs of the Infant.

F the Nurse doth not keep the Child very cleanly, not changing the Beds, or washing them each time; or as foon as they are fouled with their Excrements, their Acrimony will not fail to cause redness and smartness in the Groins, Thighs and Buttocks; and afterwards, because of the pain, these parts will inflame, which easily happens by reason of the tenderness and

of the Body.

* The outward Skin delicacy of their Skin, from which the * Epidermis is at length length separated and worn away, if timely care be

The cure of these Indispositions is two-fold; that is, first to keep the Child cleanly: and secondly, to take off the sharpness of its Urin. As to the first, the Nurse must cleanse the Child of his Excrements as soon as he hath voided them, shifting it each time with a clean Bed, washed in the Buck. As to the second thing to be observed, of tempering the Child's Urine, that cannot be executed but by the Nurses keeping a cooling Diet, that so her Milk may have the same quality; wherefore let her abstain from all things that may heat her.

Besides these two generals, cooling and drying Remedies must be applied to the inflamed parts. Wherefore each time the Child's Excrements are wip'd off, let the parts be bathed with Plantanewater, mixt with a fourth part of Lime-water; and if the pain be very great, let it only be fomen-

ted with luke-warm Milk.

Many Women ordinarily use the Pouder of a Post to dry it, or a little Mill-dust, which they strew upon it. Unguentum Album, or Diapompholigos, spread upon a small Rag in form of a Plaister, will not be amiss: above all, when the Nurse opens the Child, let her be very careful to wrap the inflamed parts with fine white Rags, that those parts may not, by rubbing together, be more galled and pained.

CHAP. XXVII.

Of the Ukers (or Thrush) of the Month of an Infant.

TEry frequently the Milk of a Nurse, that is Red-hair'd, given to Wine, or very amorous, may by its heat and acrimony cause small Dicers in an Infant's Mouth, which are called Aphebe, and vulgarly Cancers; fornetimes also tho the Milk have no ill quality in it felf, it may however corrupt in the Child's Stomach, because of its weakness, or for some other indisposition, in which acquiring an Acrimony, instead of being well digested, there ariseth thence biting Vapors, which forming a thick Viscosity, sticking like a kind of white Soot all over the Mouth, doth eafily cause and engender these small Ulcers, by reason of the tenderness and delicacy of it. This, Guido makes us take notice of, when he fays, that thefe Ulcers for the most part happen to Children by the badness of the Milk, or by its ill digestion.

Of these Ulicers, some are benign, as they that are cansed by a simple heat of the Nurses Milk, or by the Child's Blood and Humors being a little overheated; or also for having had a small sit of a Fever, and they are then very superficial, of small continuance, and easily yielding to Remedies: Others are malignant, such as are caused by a veneral Venom, or that happen after a malignant Fever, and are Scorbutick, which are putrid, corrosive, and spreading, and do not only possess

the

the superficies of the Membranes, which cover the roof of the Mouth and Tongue; but making its scabs deeper, is communicated

to all the internal parts of the || Oft-times they || Throat, as the Venereal ones have a thorough especially, which can never be Thrush, even to cared by ordinary Remedies, the Fundament.

Humors being carried to the lower parts, fo many Vapors may not afcend, as usually do when the Excrements of the Belly are too long retained.

If the Ulcers participate of any Malignity, let Topical Remedies then be used, which do their Work speedily, and as it were in an instant, to correct the evil qualities of the Humors that cause them, and prevent their further augmentation for it being impossible, if they should remain long in these parts, but their effect and virtue would be hindred, or much diminished by the moisture of the Mouth. For this purpose touch the Ulcers with Water of Plantane sharpned with Spirit of

et doth.

Vitriol, taking great care that the No harm if Infant | Iwallows none of it; and the Remedy must be so much the ftronger and sharper, as the Ulcer

are profound and malignant; as foon as they have been cauterifed with this Water, by only touching them once or twice with it, according to their bigness, depth, or corruption, that no sharp fere fities may distil upon the places not yet ulcered and upon the Infant's Throat, wash its Mouth with Plantane-water, or with a Decoction of Barley Agrimony, and Hony of Roses, continuing to touch and wash the Ulcers as it may be judged conveni ent, and until you find that they spread no further To prevent that in the use of these sharp Medi cines, not the least portion of them may fall upon the Child's Throat, and that by swallowing of them he may receive no great prejudice, for chuse rather to cauterize these Ulcers with small linnen Tents, dipt in boiling Oil, which tho after wards swallowed, cannot in the least prejudice him

的問題

him. It will also not be amis to purge the ill Humors out of the whole habit of the Child, giving him half an ounce of Syrup of Succery with Rhoelers.

If these Ulcers are maintained by a Venered Venom, these Remedies may for some time hinder their increase; but they will never be cured, unless such as are more specifick to that Malady be applied, as we shall hereaster direct.

CHAP. XXVIII.

Of the Pain in breeding the Teeth.

The Teeth, which were hidden in the Jaws, usually begin to come forth, not all at a time, but one after another, towards the fifth or firth month, sometimes sooner and sometimes late; to effect which, they cut the Gums wherewith * Never before the they were covered. Then Teeth are ready to exause of the exquisite sence start forth.

ingreat pains to the Children, that many who inherto were very well, are now in great danger of their Life, and often die, by reason of any mischievous Accidents which happen to him at that time: Hippocrates names the principal of them in the 25th Aphorism of his Third took: In progresse were quam jum dentire incipium, incivarum prarigines, sebres, convulsiones, alvi progresse, of maximo quam caninos edant dentes, of his restriction puerts, qui crassifismi sunt, of alvos duras la contra puerts, qui crassifismi sunt, of alvos duras la contra puerts, qui crassifismi sunt, of alvos duras la contra puerts, qui crassifismi sunt, of alvos duras la contra puerts, qui crassifismi sunt, of alvos duras la contra puerts, qui crassifismi sunt, of alvos duras la contra puerts, qui crassifismi sunt.

their Teeth, they are troubled with itching of their Gums, Feavers, Convultions and Loother fe, and principally when they breed their Tusks, or Dog-teeth, especially those Ghildren who are that, (or full of Humors) and bound.

The Dog-teeth, commonly called the Eyereals, cause more pain to the Child than any of the rest; because they have a very deep root, and a small Nerve more considerable, which, 'tis faid. hath communication with that, that makes the Eve move: and as Hippocrates also faith, Those Children which are very gross and bound in their body, are upon this account in much more danger than others; because the pains in these causeth a much greater flaxion of Humors upon the difeafed part with which their Bodies alway abound when they are costive. The Teeth which are first bred, are the cutting or foreteeth as well because they are soone perfect, as because, being smaller and sharper, the Gums are easier pierced through, and also withles pain, than by the rest; which are softer at the be ginning, and being larger, cannot so soon make their way, at least not without greater efforts.

of the Teeth through the Gums, which appear thin and pale on the top, and swelled and red on the sides; and if it happens that the Teeth are a long time e're they are cut, or that too many of them cut at a time, there is great danger the Children will fall into those Accidents mentioned by Hipparates in the aforesaid Aphorism, and if it do not anothly cease, they i die of it, as many do.

that may happen to it, because of the great pain; and the second, to assist as much as may be, the catting of the Teeth, when they can hardly cut

the Gums themselves.
To prevent these A

Nurse must keep a good Diet, and use all things that may cool and temper her Milk, that the Fever may not follow the pain of the Teeth; and to hinder that the Humors may not fall too abundantly apon the inflamed Gims, keep the Childs Belly always loose, to empty them downward, to which purpose give him gentle Clysters, if he be bound; but there is often no need of them, because at that time they are usually troubled with a Loosness. [Notwithst anding that, Clysters are very convenient in that case.]

As to the fecond, which helps the cutting of the Teeth, that the Nurse must do from time to time, who must pass her Finger upon the Child's Gums, gently rubbing them, that being thereby raresied, they may be the easier penetrated, and cut by the Teeth, which are ready to come forth; to which also the Child may it self be helpful, if they give it a little stick of Liquorice to champ, or a little end

of a small new Wax-candle, which is very good to fosten the Gum. There is ordinarily made use of a Silver Coral, furnished with Imali Bells, to divert the Child from the pain it then feels. Sometimes instead of Coral, they put a Wolf's Tooth in.
One must not however believe that these things have any peculiar property, as many Women imagine; But if they are helpful in this cafe, it is because of their solidity, evenness and smoothies: for the Child rubbing the Gums with it, to ease the itching which it feels there, doth by degrees diminish the thickness of them, and so they are at tength insensibly cut by the Teeth which are under. If these things do no good, because the Gums are either too hard, or too thick, that the Child may not fuffer fo much; nor, by reason of the great pain, fall into those Accidents by us above-mentioned, let the Gums be cut with a Lancet, where the Teeth are ready. Nur fes use to doit

Groat is as good or better than either.

with their Nails, but 'tis * A thin freeth better to be done with * a Lancet, because tis not for painful.

P.

A s foon as little Infants are in the least indepo-A fed, they very ordinarily get a Loofnels, to which their natural moilinels very much contributes, as is taught in the 53th Aphorism of the second Book; Quicunque alvos humidas habens, sumidem juvenes fuerim milius degum his qua siccas labem, &c. They, saith Hippowares, who have a 'loofe Belly in their Youth, are in better health than those that are bound. Besides, that all Children are of a moist Nature, and usually, during their sucking, fed with Spoon-meats, which easily and readily flow from the Stomach and the Cuts.

by reason of the great pain they have at the cutting their Teeth; for all the Humors are so overheated, that they are then very thirsty, which
makes them, endeavouring to extinguish it, draw
more Milk than their weak Stomachs can digest;
which corrupting there, a Loosness certainly follows. It may also happen, by the victousness of
the Nurses Milk, which may be too hot, (as a newhid Woman's also is) being ever impure, especially the sirft five or six days.

If the Loosness be not accompanied with a Ferver, or some other Accident, it is not dangerous, because it is an indisposition convenient to a Child's Nature and moist habit, as also to the Food wherewith it is nourished. Hippocrates assumeth

in the 34th Aphorism of his Second Book; In morbis minus periclitantur quorum natura, aut atati, aut tempori morbus magis cognatus fuerit, quam quibus in nullo horum cognatus fuerit. They, Tays he, are in less danger, whose Maladies are more familiar and convenient to their Nature and Temperament, or their Age, custom of living or the Seafon than they whose Disease hath no respect to any of these things. But however, if it continues too long, it will not be amiss to remedy it. left the Child, composed of a tender and foft substance (easie upon this account, if one may so fay, to be melted) be not too much enfeebled by it, because of the great dissipation of Spirits, which the continual evacuation of Humors flowing through the Belly effects. bot snikbul might

For this purpose let it suck well-purified Milk, giving it but little at a time, to the end it may the better digest it; and to cleanse his Stomach and Guts of the ill Howdrs, which being contained in and cleaving to them, will yet formuch the more hinder the digellion, give it a flight Infusion of Rhubarb, or a dittle compound of Syrup of Succegentle Anodine Clysters may likewise be given, made with Milk, Yolks of Eggs, and Honyof Violets; and after purging, let them be made with Plantane-water. One may then also mix the Yolk of an Egg in the Pap he eats; rub the Belly with Oil of Quinces, and lay upon his Stomach Compreffes dipt in Red-wine, wherein Province-Roses are boiled; ever having respect above all to the cause of the Loosness and the Accidents complicated with it, and using Remedies convenient to their Nature, with the total

P.

Vomiting usually happens to Children, because they often draw more Milk than their little Stomach can easily contain or digest, with which being over-charged, they are obliged to cast it up: it may also happen to them, because is bad Milk. The efforts of a violent Cough may cause the same thing, which also may be effected by their Nurses too rude dancing them in their Arn's, shaking them too much by violent rocking their Cradle; forafmuch as by those motions the Milk, being too much agitated and disturbed in the Stomach, cannot be well digested; but very often also, because it cannot be well contained in it the Infant's Belly being too much compressed and swathed with his Swathes and Blankets in which he is swadled, which makes him throw it up, because of the pain he feels. To all these Causes, the sweetness and luke-warmness of the Milk, wherewith the Infant is nourished, contributes much.

When the Vomiting is too frequent, 'tis fit it should be stop'd, lest by the Infant's continual

rejection

rejection of the Nourishment, he becomes extreamly weakned for want of Food; and pollibly the action of the Stomach fo perverted, that it can hardly be re-established after that this action is turned into an habit. 120111110

To cure this Vomiting, regard must be had to that which causeth it: as, when the Child sucks more than it should, the Nurse must not give it fo much, and but little at a time, that the Stomach may the easier contain and digest what it receives: if it be the ill quality of the Milk, the Nurse must be changed for a better; if by a Cough, it must be helped by things fit to appeale it, according to the different causes wherewithit is excited. The Nurse must not dance it so rudely, nor nock it to hercely after it bath fucked that the digestion of the Milk may not be hindered by these agitations. Care must likewise be taken, that it be not too close wrapped and swathed upon the Stomach, but that it may be freely extended according to the quantity of Milk received; and befides all this, if any ill Humors be contained in it, it will be very convenient to purge the Infant with a gentle Infusion of Rhubard, or half an ounce of compound Syrup of Succery, and after that it bath been thus purged, if judged to the purpose, it may take a little Syrup of Quinces to for-tify the little Stomach, having also upon the region of it for the same purpose, Compresses wet in Red-wine, in which Provence-Rofes, Cinamon and Cloves have been boiled. CHAP. XXXL

Of a Hernia, or Rupture in Children.

dilated are caller re-puncel; as will a malate TO the end we may not deviate too much from our undertaking, which is only to observe some particulars concerning Infan'ts Maladies, we will not flay to explain, nor throughly to treat of all the different kinds of Hernia's, but be contented flightly to examine those which usually happen to them, as the intestinal; sometimes as compleat in Children as Men, as when the Intestine falls into the bottom of the Scrotum, at other times incompleat when it doth not pass the Groine: It may be likewise sometimes, though rarely, the * Epi * The Camle. ploon, which makes the Rupture, 200 gants

and falls down alone as the Intestine doth; and fometimes both the one and the other are there drebol : ayob asimi

found together.

The most frequent causes of Ruptures in little Children are their fierce Cries and violent Coughs. to which the Moistness and Softness of their Bodies doth not a little contribute; and also when they are too straitly swathed, because their Belly (not being able to be fufficiently enlarged, when they cry or cough much) is strongly forced downwards, by reason of which these Hernias, or Ruptures, are easily made.

This mischief must be remedied assoon as discovered; for the longer it is neglected, the harder it is to be cured: because by the continual falling

Lib.IM

of the Intestine, the place through which it falls, is every day more and more dilated. But as Hermia's easier happen to Children, because of the tendernese of their Bodies, so likewise are they sooner cured than in ancient Persons, because the Parts dilated are easier re-united, as well by reason of their tenderness, as that the Intestine (being reduced and contained in its natural place whist the Child is growing) is enlarged in proportion to all the other parts of the Body, and the place dilated desent by little and little, and closeth by the compression of the Trussor Swath rightly applied upon its most classificate of as a most of regard

- Whilest Children are in Swadling-Clouts, the cure of true Ruptures, which happen to them, multinot be undertaken, but by a Swath-band, which alone is capeable to cure both the perfect and imperfect : and is effected by a Royler, putting a Compress or Trus just upon the Rupture. after having first reduced into their natural scituation the Intestine and Epiplogn likewise, if it were fallen down: To do this, you must lay the Child with the Head low, then with both Hands reduce it by degrees, and thrusting with one the Tumor very gently, and caoling with the other the Inte-. Rine to re-enter, just at the dilatation, and keeping in with it that which re-entred, to hinder its coming forth again a continuing to do thus, until the reduction be compleated, after which one must lay a Compress or Truss thick enough upon the dilated place, then fwathe it on this manner: Take a Rouler of breadth and length proportionable to the bigness of the Child so that it go three or four times about, lay then the first end upon the Child's Belly,

Belly, towards the side opposite to that where the Hernia is, afterwards guide it under the Buttock, then conduct it in, bring it upwards over the applicated Compress; bring it thence under the Reins, on the same side quite round the Body; afterwards pass it as at first, continuing to do so till you come to the end of it, ever observing, that the circumvolutions which pass over the Groin, be brought from below upwards, to keep it the better up, and to fasten them all with small Pins on the top of the Compress, that so the swathing may be more firm.

It will be very convenient that the Nurse carry the little Infant to a Chirurgeon, to learn the manner of reducing the Rupture, and exactly using the Swathe, instead of which a small Truss may be had, which will be yet better for this purpose, because there is not so much trouble in removing and undoing it fo often as there is in a Swathe; for which purpose it ought to be waxed, or oiled on each fide, that the Child's Excrements may not rot it. Now if one would have these Swathes or Trusses speediy to cure the Rupture, tis very fit the Child should keep its Bed, at least forty days, or more, according to the bigness of the Dilatation: let care be taken to prevent its crying and coughing as much as may be, and that the Belly be not swathed too strait, lest those things do again force the Intestine to come forth. Some before they apply the Swathe, foment the part with Smiths-water, and then lay the Plaister of contra Rupturam upon it; but this is not necessary, when a Truss or Swathe may be fufficient, provided it be well applied.

Besides these true Hernia's, of which we have

just fpoken, there may be allo false ones, wherein no part falls down, but only there is a diffention of the Membranes of the Stroum, and Testicles. caused by some Matter there collected, as well through the natural weakness of those parts, as with being bruifed and pressed in a bad Labour, amongst which the watry and windy happen oftenest for as for the fleshy and varicose, they happen never, or

but very rarely in little Infants.

412

OVER

For the cure of the Watty, called Hydrocele, which is caused by Waters contained in the common or proper membranes of the Testicles, apply to the fwelling Remedies that may refolve and dry up the Waters therein, and diffipate the wind. and afterwards fortify the parts. They may be resolved with Fomentations of the Decoction of Cammomile, Melilot, Rue, Majoram, and Fennel, in which also the Compresses to lay upon them may be dipt; they may be dried with Lime-water, wherein a little Allom is dissolved; and after that the greatest part of Waters are resolved and dried away, let the parts be fortified, left others be there ingendred, by putting to it Comprelles wet in red Wine, wherein Rofes and Allum have been boiled, ever having respect to the cause of the Hydrocele, and that which leeds it; but if these Remedies prove in vain, the Tumor must be opened, to evacuate the Waters by a fingle prick of a Lancet, with which one must be fatisfied in little Infants, who for the weakness of their Age, tenderness of their Bodies, and want of the use of their Reason, cannot then undergo a greater Operation for the cure of an Hydrocele.

D

M

CHAP. XXXII.

Of the Scabs which are upon the Head and Face of young Children.

have no malignity, and are only caused by the superfluity of some Humors, which for being simply over-heated, are easily conveighed to the Head and Face, where they make little Pimples, in which these Humors continuing are corrupted and converted into Matter, which after eat through and ulcerates the simple superficies of the Skin, and drying round about the place where it came out, make those crusts there, usually called scabs, with which some Children's Head and Face are every where so covered, that they seem to have a Cap and a Mask of one piece, for which nothing can be seen, but only the Eyes and edges of the Lips, which are exempt from it.

of

P.

Many Personswill have these Scabs, as well as the Meazels and Small-pox, to proceed for the most part from some superfluity and residue of the mentruous Blood, from which the Infant purgeth it self after it is born; which because it cannot be well rectified, is so driven out that it may be cast off as useles: but it is often from the ill nourishment of the Children, who sometimes suck more Milk than they can digest, as also from the ill quality of it, whence is engendred a quantity of viscous and corrupt Humors, causing these Scabs, which come most upon the Head and Face, because

they

they are moifter, especially in Children, than any other part of the Body.

These Scabs may be known not to be malignant, when they are superficial, moist and yellowish, and when the Scabs being taken off, the Skin appears red and crimfon, without being deeply ulcerated.

The course of these Humors must by no means be hindred, by driving them inwards, because their evacuation defends little Infants from many ill Difcases; and we ordinarily see them, whose Bodies have a long time purged away fuch superfluities, to be in better health after they have cast forthall this kind of corruption: and as Guido faith very well. Tho to the fight thefe Scabs are ill, yet in respect of their cause they may be very good; because nature is thus accustomed to purge the Infants Bodies in thrusting out these Excrements, but endeavours must only be used to hinder the generation of more of these ill Humors in the Child; wherefore a healthful Nurse must be provided for it, whose Milk is perfectly purified, and very cool; the Child's Belly must ever be kept open, and purged, if necessary, with a little Syrup of Rofes or Succory, that so the Humors may not be fent in too great abundance to the Head, nor the Sanies under the Scabs may not, eating and corroding the Skin, cause deep Ulcers; it will notbe amis also to make the Scabs fall off that there may be a freer vent or iffue, for which fresh Butter is ordinarily made use of, rubbing them therewith to moisten them, or with the Liniment of Oil of fweet Almonds, laying afterwards a Cabbage or Beet-leaf upon it, changing them twice or thrice in a day, to avoid the offence and corrup

of the moisture which these things draw

These things ought to be continued till the child be perfectly cured, and no other, because they do very much suppurate the Scabs; and only draw away the superfluous Humors, which should in no wise be retained within, for fear lest a worse Malady happen after the evacuation, of which the places will dry, and heal of themselves; all this while the Child's hands must be pinned down, lest by rubbing and scratching the Scabs when they inch, should by irritating these parts cause an Infammation, whereby a yet greater abundance of Humors will flow thither.

CHAP. XXXIII.

Of the Small Pox and Meazels in Infants.

The small Pox is a contagious Disease to little Infants; which sometimes also happen, tho were rarely, to Persons already advanced in Age, which abundance of Pustules all alike do break with throughout the superficies of the Skin, encodered from the impurity of the Blood, and other summers which Nature there casts out, as an unitifal emunctory to cleanse the whole Body of sem.

Many Ancient as well as Modern Physicians atibute the cause of this Disease, to the residue of a menstruous Blood, wherewith the Infant was surished in the Mother's Womb, which after its ith coming to be heated, and to boil in the Ves-Dd sels,

gr

fels, is separated from the whole Mass of Blood which hath been fince engendred, and is spread throughout all the superficies of the Body, to be in that manner rejected and expelled. This reafoning (according to my opinion) is not very probable: for we daily fee many Men and Women, who tho very aged, have never had this Malady, which they could never have avoided, if it proceeded from the remainder of the menstruous Blood, wherewith every one, without exception, is nourished in their Mother's Womb. They which maintain this opinion, reply, that the fome Persons be exempted from this Disease, 'tis because their strong and robust Nature could digest and confume those superfluities, or else purge them off by other ways, as by a Loofness, or in some manner more infensible: However they must confess and agree, that this menstruous Blood (if it were that) could not remain hid and quiet in the Body for 30, 40, or 50 Years after Birth, without producing its effects, as we fee in feveral that have not this Disease till those Years; but 'tis much more credible, that the cause of the small Pox is the corruption of a contagious Air, which doth principally infect and spoil the Blood of Infants and Youth, who are more disposed to it than they that are further advanced in Years, because of the tenderness and softness of their Bodies, and more at certain Years, and some Seasons, than at others, as it may eafily be perceived every day; for in pestilential times, the small Pox is much more common in the Spring and Summer, than at the end of Autumn or in Winter.

The

The Small Pox doth | dif- | Hardly in Kinds, for from the Meazels, tho only in Degree.

they are so like in the beginning, that often it is dissipult to distinguish them one from the other till after the second or third day, when the Small Pox, which at first appeared like the Meazels, begins to arise into Pustules, and to whiten. The Meazels are caused of a Blood bilious and over-heated, which only makes red spots throughout the Skin, without or with but very little elevation, which comes soonest and principally on the Face; but the Small Pox proceeds from a fanguine and pituitous Matter, which being more thick and viscous, produceth many Pustules rising high, and by degrees growing white and ripening, after which their Matter drying away, they are converted into Scabs.

Of the figns of the Small Pox, some precede and others accompany them; they that precede are

a Fever, Sottishness, Dizziness and Pain in the Head, very || troubled Urin, weariness and pains in the Reins

|| Commonly whitish, like that of Horses.

with

and Loins, Reachings and Vomitings, difficulty of Breathing, frequent Yawnings, Sneezing, itching of the Nose, redness of the Eyes, and universal weariness all over the Body: but when the Small Pox begins to come forth, there appears, about the third or fourth day, many Pimples rising every where, which grow and augment as well in bigness as number, till the eighth or ninth day, during which time they ripen and whiten by degrees; the Head and Face swells, the Eyes are closed by a great flux of Humors thither, the Nose is stopped

.. Dd 2

with Excrements which there dry, the Patient is troubled with a hoarse Voice, a dry Cough, sore Throat, and great difficulty to breath; and then all the parts of the Body are so swelled through the abundance of Pimples, that it appears blown

up and monstrous.

There may be two kinds of Small Pox, according as it is more or lefs malignant; the first is that which is accompanied with but a simple emotion of a Fever, only stirred up by an ebullition of Blood and Humors, soon ceasing from the beginning without any evil accident, which ripens, suppurates, and is easily and speedily cured; the Pustules of these do rise full, and the matter is white, sinooth, and well-concocted, and the Infants easily escape it, if they are but well tended.

|| They have both the same cause.

But the || other fort of Small Pox, totally malignant, is that which is caused from fome contagious and pesti-

lential Humor; where the Pustules are flat, brown, obscure or livid, having small black Spots in their middle, they come forth but slowly, and no Suppuration follows, or tis very bad, sanious, watry and accompanied with pernicious Accidents, as a Malignant Fever, Phrenzy, great difficulty of Breathing, Faintness, Dysenterie, and others, which often are mortal; or at least malignant Ulcers, foulness of the Bone, loss of Sight, disfiguring and great deformity of the Face, or lameness of some Member, according to the places where these vitious Humors are conveyed and retained. These Havocks are caused by that which all Women call usually the Master-pock, which is nothing

nothing else but many Pimples, by their nearness and bigness joining together, and mixing their Matter, which being thus in great quantity amasted into one place, gnaws and corrodes the part deeper, than if they were spread and disperst in many distinct Pultules; for which cause its Cavity remains much more hollow and deformed, by reason of the great loss of Substance there usually made; and depositing and transporting this acrimonious Matter upon the Bones or other parts, it fouls them, or causes their other Accidents, as we have recited.

ces

re-

ich

is

ng

The Prognostick is drawn from the different Nature, which we have now explicated: for if the Fever be small, and that it ceases proportionably to the coming forth of the Pimples, if they be not in too great quantity, and that they ripen and whiten speedily, it is a good fign; but if the Fever be violent in the beginning, and augments every day with difficulty of Breathing, and other Accidents, according as the Pimples come forth; if they are in great number, black, flat, dry, and without Suppuration, it is a fign of death: befides, Infants are not in so great danger as elder Perfons, in as much as this Difease is more agreeable to their Age and Nature, and that they also have a thinner and fofter Skin, through which this Matter is easier expelled, than through theirs that is harder, and whose Pores are less open.

As to the Meazels, they are never so dangerous as the Small Pox, because its Matter being more subtile, is much easier and sooner evaporated, which usually terminates in three or four days, at the end of which sometimes follows the Small Pox,

Dd 3 which

i

2

to

ta b

th

CO it

th

hi

to

which often makes fome, as we have faid take them one for another in the beginning, at which

time they appear almost the same.

The cure of the Small Pox particularly confiles in the force and virtue of Nature, that endeavours to expel these malignant Humors; wherefore it must be assisted to overcome them as much as may be, and fortified, that it may be able to finish the Work it hath undertaken, being very careful not to divert it from its Operation by an untimely bleeding, or a Medicine unfeafonably given. To remedy this Malady, keep the Child to a good diet, avoiding folid Meats all the time, giving it only Spoon-meats, as Broaths made with Veal and Fowl, or a little of a good Jelly; let his

Beware of too great of those things that too much heat.

Drink be Ptylan, made with cleanfed | French-Barly, the Coolers, as much as Roots of Dogs-grass and Lix quorice, and a few Raisons of the Sun. If it be a fucking Infant, he must have no

Pap till he be perfectly cured; and fince then by reason of his Age he cannot receive Remedies often enough, nor other food at the Mouth than Nurses Milk, let her observe a good Diet her self, to refresh and temper her Milk, as much as may be; let her not carry the Child into the Air, but keep it in a close Room, neither too hot nor too cold: for too hot Air weakens it extreamly, by greatly resolving and dissipating the Spirits; and a too cold Air drives the Humors back into the Body, and hinders the coming forth of the Small Pox. Some advise it to be kept in a Bed hung round with Red Curtains, because this Colour doth ordinarily

dinarily move the Humors from the Centre outwards: but this often hurts the Eyes, and inflames them by its rays; to which also in this Disease there happens a great flux;

wherefore I believe a || fofter || Green the best Colour, what-ever it be, ought of Colours.

to be preferred; but custom

will have it so. The Infant's sleep must be moderate, that the Humors being thereby better concocted and digested, the coming forth of the Pustules may be the freer; it ought not to be to a Stupidity, for that would be a sign Nature were opprest; let the Belly be kept moderately open with gentle Clysters, that the Excrements may be

thence evacuated, if too long retained.

But when the Small Pox is in the beginning accompanied with a great Fever difficulty of Breathing, and other Accidents, the principal Remedy is Bleeding, altho most Women not understanding the case, do condemn it, and will not suffer it to be done to their Children, imagining that it would hinder the coming forth of the Small Pox; and if it happens that the Children after bleeding die, although it be through the greatness and malignity of the Disease, they will not fail to impute it to Bleeding: but it is very certain this is a profitable Remedy in the beginning of this Disease, for by this means all the Humors are cooled, and the fulness of them being evacuated, Nature easily commands and overcomes the rest. As to purging, it ought not to be used in the beginning, lest by the agitation it makes in the Humors, Nature be hindred and diverted from doing its work; but towards the end it will be very convenient to Dd 4

empty the remaining impurities, left these Reliques falling upon fome parts should spoil them.

All this while fuch things must be used as may fortify the Heart; as Cordials, not of the fort of those pretended Cordial and Threacle Waters which ordinarily are made use of, and rather cause one to Vomit, than fortify the Heart; nor those Ponders of Pearl and Bezoan, and other fuch-like trifles, which many superstitiously believe, without any reason, to have a specifick quality to this purpole; but the truer and more falutary Cordials are, the breathing of sweet and clear Air, and wholesom Diet, with the moderate use of things agreeable to the Stomach, and which please and comfort it; fuch as are Syrup of Limmons and

Specificks.

iniged on Pomegranars, mixed with the * A French-man's Child's * Pryfan; or a little Ptyfan must be ex- Wine well allayed with Watold before the best ter, which is the Cordial of and most approved Cordials: if the Fever be not great, and that it is a is a xog listing fucking Child, the Nurles

Milk ought to be fufficient for all.

As to outward Remedies, or application to the Puftules, 'tis best to leave it to Nature, only affifting it as we have faid. And to the end they may ripen easier, as foon as they begin to appear, which is about the third or fourth day, anoint them, principally those of the Face, with Oil of Sweet Almonds rubbing them with a Feather dipt in it: fome mix a little Cream with it, others use only a little fresh Butter, and others again old Hogsgreafe melted, and often washed in Rose-water, and well beaten in a Marble Mortar, with which they

they anoint them till they are perfectly healed: and when the Puffules are ripe enough, which is known by the whiteness and itching that follows, and is usually about the ninth day, the biggest of them may then be pierced to empty the Matter, lest by its too long stay there, it ulcerates and corrodes the parts too deeply. This may be done with a gold or filver Needle, or by cutting off the tops with Sciffers; afterwards to dry them up, anoint the Face with a Liniment made with fresh Cream mixed with white Chalk, contiming this Remedy till the Scabs be quite fallen off, using it Nights and Mornings; or elfe with Ointment of Roses mixed with a little fine poudred Cerufs.

To hinder the fmall Pox from cauling too great aflux of Humors upon the Eyes, 'tis good using from the beginning some cooling Remedies, that, by moderate driving back, may hinder it. There is ordinarily used Rose-water and Plantane-water mixed together, with which they bathe them from time to time: most Women steep a little Saffron in it; but because of its strong scent, I chuse rather the Waters alone: The Nurses Milk is likewife very good to appeare the pain. Care must be also taken, from time to time, to unitop the infant's Nostrils, that he may breath the freer, which may be done with small linen Tents; and to help the Throat, which is always hoarfe, a little Syrup of Violets mixed with his Ptylan, may be used; and to cut the Phlegm that sticks there, give it a little Syrup of Limmons or Pomegranats, or a Garogfgarifm of Vinegar and Water; but the Milk only is fufficient for fucking Children. Let us now fee ater, hich how a fucking Child must be governed in the they French Pox. CHAP.

CHAP, XXXIV.

How to cure the Venereal Lines in Infants.

F the Small Pox, of which we have lately dif-L coursed, be a contagious Molady, it is not fo

'Tis sufficiently known that the small Pox is contagious to Toung and Old, according as each Body is prepared for Infection.

|| Seldom to any but whom they suck.

* ordinarily but in respect to Infants, for it is hardly communicated by frequentation to elder Persons; but it is not the same in the Great Pox, the venom of which is fo pernicious and fusceptible, that a fingle Child that hath this Disease, is capeable to communicate it as it hath bin very often feen, to whole Families, and as well

to Old as Young. Tis a fad thing to fee poor fmall fucking Innocents afflicted with fo ill a Difease, which besides that it makes them suffer the pain of a Sin of which they are innocent, it makes them also very often be abandoned by every one, and deferted in this deplorable state by their own Mother her felf.

Those that have this Disease so young, either bring it with them into the World from their Mother's Womb, which may be known if she were infected with it; or if it had at its birth Puffules and Ulcers in divers parts of its Body, and principally about the Belly, towards the Fundament, and on the inside of the Thighs, as also on the

Head:

Head: or else they got it since, and took it from their Nurse, who is in like manner infected with it; then the first impressions will appear about the Month of the Child, where Ulcers will breed, because of the acrimony of the ill Milk it sucks, which being its nourishment, will not fail to communicate

its venom to all the parts of the Body.

Tis very hard to cure Children that are born with this Disease, for they very soon die after; because their whole Substance cannot be re-established, having for its foundation had fo bad a Principle, as the Mother's Blood infected with fuch a venome, wherewith they have been engendred, formed and nourished: but as to those who have received it from their Nurses only, there is much more hope of, and lefs difficulty in their cure; because the venom of the bad Milk not communicating it felf immediatly with its whole substance to the Vessels of the Infant's Body, doth not there make so great a spoil as in the other, where the Blood, with which it is only nourished whilst it is in the Mother's Womb, is conveighed to him, and spreads, such as it is, throughout all the parts of its Body; for then there is only the pureft of this pockey Milk, or to fay better, the less impure, which (being changed into Chyle in the Stomach, and purged by the Intestines of the greatest part of its Excrements) can by mixing afterwards with the Mass of Blood, alter and corrupt it by the ill quality that always remains in it, notwithstanding the different preparations it hath received; however the Child infected by the Nurse can never be cured, so long as the fucks it, forasmuch as ther Milk is ever infe-

eted with that corruption and venom; and the worst is, that changing her for another, as one is

obliged to do to cure it, 'tis a very great hazard if it doth not communicate this contagious Ma-

lady to her.

It may be faid in general, that the cure of the Great Pox is very difficult in little fucking Children; for by reason of the feebleness of their Age, they cannot then either take of support, without great danger of their Life, the violence of Remedies convenient for it; wherefore it were to be wished, that by a palliative Cure one might delay a compleat one, until they be three or four Years old; but fince there are very many who would perish before they were so much as a Year or two eld, because this fifthy Disease doth ever increase, and the Symptomes of it do much easier make impressions upon their Bodies, because of the delicacy and tendernels of them, than upon fuch who are more advanced in Years; therefore one is fometimes obliged to undertake the Cure, tho the Child be yet sucking. This enterprise is then in truth very perillous, but one is constrained to resolve on it, when there is no appearance or hope that the Child can otherways escape. fore the means follow.

First, therefore, change the Nurse, if she be infected, for one whose Milk is well purified; and if it be not fo, let her be blooded and purged, as the cafe requires. Most would have her, during the whole course (that her Milk may be very physical) nle a Treacle-water, and a Sudorifick Decoction; but belides, that I think thele things will be very inestectual, I fear, lest by heating her Milk, it may prejudice

prejudice instead of profiting the Child; and I hould advise her rather to keep a temperate and cooling Diet; and that the may not her felf receive any hurt, it will not be amiss for her to wash her Nipple with Wine, every time she gives the Child fuch; and that she now and then take a Purge, to keep her Body clean, and less disposed to receive this Infection.

f

e

e

But very often these poor little Children thus afflicted, are so unhappy, that they cannot find any Nurse, that will by giving them suck, expose themselves to the hazard of getting the Disease: in this case we must chuse one that hath abundance of Milk, and is foft milcht, to the end that by gentle squeezing of it, there may fall enough into the Infant's Mouth for its nourishment: or that by having milked fome in a Glass, they may feed it with a Spoon; or elfethey may dip a piece of Linnen rolled up in it, and give it to fuck. But the best way to avoid the Child's spoiling any Nurse, and to exempt it from such a subjection is blet it fuck a young Goat, fed on purpose with good Hay and other convenient things, that fo the Milk of it may be very good.

As to the Child, it is most certain it can never cured of a confirmed Pox, but by the use of Medicines wherein Mercury is mixed, which hiherto is esteemed the proper Antidote to the poion of this Disease: wherefore after bleeding and orging him with Syrup of Roses, or of Succory, t him, if his strength permit, be a little anointed with a mercurial Ointment, wherewith only the offules & Ulcers must be rubbed; in doing which y degrees, reiterating the Unctions, a small Flux

T

is th

the

will be raised, which must be almost insensible delt the Humors being flirred and conveighed in too great abundance to the Month, cause it to swell too much, and breed there naughty Ulcers, which may hinder the fucking of it: Wherefore but a small quantity of Mercury must be mixed with the Ointment, being better to be a longer time in curing, than to precipitate: for this cause having used a small Friction or two at the most, forbear five or fix days, observing to what degree the Infant will be moved with it; and then by the effects of the first, you may judg whether it is neceffary to reiterate them, and with what Dose, which can never be precifely directed; because all the Habits of Infants are as well different as those of Men, amongst whom some will spit sooner with one Friction, than others with fix immediatly after one another. But in this case there is nothing near fo great danger of hurting by too little, as there is by too much: it being more eafy to repeat and augment the Dose, when not ftrong enough at first, than to stop the Effects when it exceeds.

One may, instead of Frictions, or together with them, wrap the Insant in a Bed lightly persumed with Mercury; and as to the Ulcers which breed in the Mouth, let the Nurse wash them with Barley-water boiled with Agrimony, adding to it a little Hony of Roses, or Syrup of Wormwood with white-Wine, wherewith also the Nurse may often wipe off the Froth which is usually there gathered; which, that he may void the easier, let make upon his side, and not upon his back, lest being falling into the Stomach, or upon the Lungs,

fund should chook it. Let him always be kept warm, without carrying him to the Air, watching diligently the effect of the Remedy, which in this case ought to be managed by a prudent and expert Chirurgeon, and not left to the discretion

of every one.

35,

The common way to make this Ointment, is to take half an ounce of Mercury, which must be well cleanfed from its filth, by passing several times through a double Linnen, afterwards beat it well in a Mortar with four ounces of Hogf-greafe, formuch and fo long till it is wholly incorporated; which being done, take two drams of this Ointment for each Friction, more or less, according as the Infant appears to be strong and disposed to be moved by it, of whom chiefly the Puftules and Ulcers must be anointed, as we have said. Pigray affirms, that he hath feen Infants cured by being rubbed with Hogf-greafe, only stampt in a leaden Mortar; but it is ever by reason of the Mercury, from whence the Lead derives all its quality.

CHAP. XXXV.

How to binder Childrens growing squintey'd, arry, crooked, or lame.

THe Bodies of little Children, by reason of their tenderness, are like soft Wax, or young Trees, to which 'tis easy to give such a Figure, as is in the beginning defired; wherefore one must be then very careful that the good conformation of their small Members be not vitiated for want of prudent

prudent conduct, or elfe being fo, they may a dailigent care reduced to their natural state, so amongst other things, endeavour to prevent the Child's squinting, growing awry, crooked o lame, and to redress any of these whatsoever, a

much as possible.

To prevent its Squinting, chuse a Nurse whose fight is stable and right, lest by her ill example he gets an ill habit; and, as we have faid elfewhere, let the Cradle be ever so placed, that being laid in it, he may always fee the light directly before him, either of Day, Candle, or Fire, left by being on one fide, he come to turn continually his Eyes that way, whereby he will be in great danger of growing afquint. Paulis Eginetus, and Parem also, would have a squint-eyed Infant's fight redressed, by putting a Mask upon his Face, with only two small holes right against the Eyes to see through; which will cause him, perceiving no light but through those holes, to hold his Eyes ever that way, by means whereof they will be effablished in a right scituation, and by degrees quit the ill habit they had gotten of looking aside. This counsel seems good in appearance, but I believe it will be very inconvenient for a Child to follow it: belides, that the least removing of the Mask, on which fide foever, the little holes not corresponding perfectly in a direct line to the middle of the Eyes, the fight will be thereby more perverted.

To prevent a Child's growing crooked, awry, lame, the Nurse must swaddle its Body in a scienation, equally extending the Arms and and swathing the Child sometimes one way, many another, lest swadling it always one

way,

the parts should take an ill habit. When the staid in the Gradle, he must not be streight can back, and not bending; and above all, when the Nurse holds him in her Arms, let her carry him sometimes upon one, and sometimes upon the other; for holding the Child's Legs always on the same fashion, it would be a great hazard if they did not at length grow crooked: and it is often the only reason, that so many Children have crooked Legs, especially about the Knees, and this sew Nurses take notice of, which not-

withstanding is of great consequence.

When these parts have an evil conformation in their Figure, they must be helpt with Swathes and Boulsters conveniently placed, to keep the Parts in a good posture whiles the Child is in fwadling Clothes; afterwards, being grown a little bigger, one may use little leather Boots, somewhat stiff with which the Legs must be straitned; and if the Foot be only awry, Shoes underlaid of one fide higher than the other, will ferve the turn. When the Breaft or Back-bone are in fault, it must he helped, if possible, or at least hindred from growing worse, and the Fault may be hid, by ordering the Child's clothes with Paltboard, Whalehone, and Tin, placed where the Chirurgeon hall think fit, to reduce the milhapen Part to a better Figure.

Having hitherto mentioned the most ordinary Diseases befalling little Infants, 'tis not necessary here to make a larger description of them; for as for those that we have not treated of, since they may indifferently happen to all sorts of Ages, they have nothing peculiar in respect of Children, as to

the knowledg or care of them, but only for the

There now remains only to finish our under taking, that we give necessary directions in the choice of a good Nurseau no manufacture of the choice of a good Nurseau no manufacture of the choice of the Choice of th

ribas: 5 CoHwa Pi XXXVI bib

is often the only realou, that so many liders in a unitional graff and this ten Natrik though at the organization of the withstanding is of prest confequence.

He first and principal of all the qualities in a good Notices that the be the own Mother of a Child as well because of the mutual agreement of their tempers, as that having much more love for it, the will be much more careful than an hired Nurse, who ordinarily loves her Narie-child but with a fergried and feeming love, having no other end or foundation, but the Hope of her recompence the expects for her pains by a mercenary hire. Wherefore the true Mother, tho not the best Nurse, should ever be preferred before a Stranger. But because there are several that either will not, or cannot fuckle their own Children, whether it be to preferve their beauty, as all Perfons of Quality, and most of the Citizens do; or that their Husbands will not fuffer them, nor be troubled with fuch a noise; or that being ill or indifposed, they cannot, there is then an Obligation to provide another Nurse, which should be chosen as convenient for the Child as may be.

Mow even as we see Trees, tho of the same kind, and growing in the same place, being afterwards trans-

raniplanted into another Soil produce Fruits of a different taile, by reason of the pourishment they raw thence; Even for the Health of Children, and ometimes their manners, depends on the nourishment they receive at the beginning: for as to the health of the Body, tis well known it answers the Humors that all the parts are nourished and maintained with which Humors ever retain the nature of the Food whereof they are engendred: As fon the Manners they ordinarily follow the femperament, which also proceeds from the quality of the Humors, and the Humors from the Food. By this confequence, as the Nurse is, so will the Child be, by means of the nourishment which it draweth from her; and in fucking her, it will draw in both the Vices of her Body and Mind. This appears very early in Animals that fuck a ftrange Dam, for they always partake something of the creature they luck; being accordingly either of a mild or hercer nature, or of a stronger or weaker Body; which may be noted in the example of young Lions, tamed by fucking a domestick Animal, as a Cow, Als, or Goat; and on the contrary a Dog will become more furious or fierce if it fucks a Wolf

Themecellary Conditions in a good Nurse, are ufually taken from her Age, the time and manner of her Labour, the good constitution of all the parts of her Body, and particularly of her Breaks, from the nature of her Milk, and in fine, from her

good Manners.

As to her Age, the most convenient is from twenty five to thirty five Years of Age because the during this space the Woman is most health Ee 2

strong, and vigorous; she is not fit before 25, because her Body not having yet acquired all its dimensions, cannot be so robust; nor after 35, because not having Blood enough in so great about dance, the cannot have Milk enough for the nonrillment of the Child. However some Women are indifferent good Nurses from 20 to 40, but very rarely before or after.

As to the time and manner of her Labour, it must be at least a month or fix weeks after it, that fo her Milk may be throughly purified; because at that time her Body is ufually cleanfed of the Lochia, which follows Labour, and the Humors are no longer disturbed with it; nor must it be above five or fix months, that so she may be able to make an end of nurling the Child, that there may be no necessity to change her afterwards for another: The must not have miscarried, but have

been brought to Bed, at her full * May not a time, of a healthful * Son, for Daughter ferve tis a mark of a good Consticond or third Child, that she

may, by experience, know the better how to

tend her Nurfery.

As to the healthful constitution of her Body, tis the principal thing, and on which almost all the rest depends. In general, she must be very healthful, and of a good habit, not fubject to any Diftemper; that the come of Parents that never had the one in the Reins or Bladder, not fubject to Gout. ing's-evil, Falling-sickness, or any other heredi-Difease; that she hath no Spot, nor the least any Venereal Distemper; that she have

have no Scab, Itch, Scald, or other filth of the like nature; that she be strong, the better to watch and tend the Child in all things necellary for it; that she be of a middle Stature, neither too tall nor too low, too fat nor too lean; because a Person of such a natural Symmetry, persorms all the Functions more perfectly, and as is usually said, In medio consistit Virtus. But above all, she must not be with Child; let her be of a fanguine Complexion, which may be known by her Vermilion Colour; not altogether fo red, but inclining to white; of a firm Flesh, not fost; she must not likewise have her Courses, for that's a sign that her Blood is too hot, either because her Temperament is fuch, or from some amorous passion or otherways; neither must she be subject to the Whites, for fuch superfluities are a sign of a bad Habit; the must not be red haired, nor marked with red Spots; but her Hair must be black, or of a Chesnut brown; she must be well shap'd, neat in her Cloaths, and comely in her Face, having a sprightly Eye, and a fmiling Countenance; she must have good Eyes, found and white Teeth, not having any rotten or spoiled, left her Breath should smell; the ought to have a fweet voice to please and rejoice the Child, and likewise ought to have a clear and free pronunciation, that he may not learn an ill Accent from her, as usually red-hair'd have, and fometimes also those that are very blackhair'd and white Skins; for their Milk is hot, sharp, and stinking, and also of an ill taste; she must not have a strong Breath, as they who have a stinking Nose, and bad Teeth, as we have said before; because the Nurse that constantly kisses

Lib.III.

Child, would infect its Lungs by often drawing in her corrupted Breath; her Breatls ought to be pretty big to receive and concert there a furnicient quanty of Milk, but not big to excels; they mult be found and free from Scars proceeding from former impoliumes; they mult be indifferent firm and fleshy, and not slaggy and hanging, that their natural heat may be the Irronger. The Nurse must be broad-breasted, that her Milk may have more place to be prepared and digested in, and because his a sign of abundance of vital heat: As to the Nipples, they must be well shaped, that is, not too big, nor too hard, nor grisly, nor sunk in too deep, but they must be a little raised, and of a moderate bigness and firmness, well perforated with many little Holes, to be soft milcht, that the Child may not take too much pains to draw the Milk by sucking and pressing them with its Mouth.

If a Nurse hath all these receited good qualites respecting all the parts of her Body, there is reason to presume her Milk will be well-conditioned, which may be known first by its quantity, which ought to be sufficient for the Child's nourisliment; nor must it be too much, self that not being all drawn forth, it curdles and inslames the Breast by its too long stay there; but however, it is better to have too much than too little, for she may give the over-plus to another Child. It must be of a middle consistence, neither too waterish, nor too thick; which may be easily judged, if the same milking some into her hand, and turning that on one side, it immediatly runs of but many fixt, without running by the furning that hand, its a mark it is too thick and vis-

consis There ood is of a combilience between both which flides off gently in proportion to the thrift ing of the Hand, leaving the place whence it hid httle frined, As to the doloin, the whiteft is the best, and the lesser white it is, so much the worfe to minuff be of a fweet and pleasant amell, which is a tellimony of a good temperament, as may be feen in red-hair'd Women, whose Milk bath a four; stinking, and bad fcent; and to be complead in every quality, it must be well tafted, that is, fweet and fugared, without any Acrimos my or other frange tafteabas M mivod sand al

We must not forget the principal and best Condicions of a Nurse, which contists in her good Mannetes wherefore let her be vigilant and care ful to cleanfe the Child as foon as there is occase ion; let her be wife and prudent, not subject to choler, nor quarrelfome; as well because in the beginning it may make bad impressions on the Child, as because this Passion doth extraordinarily heat the Milk; fhe must not be melancholy, but merry and chearful, fmiling often to divert it; she must be sober and not given to Wine, and vet less to the excess of Venus; but she may moderately use the first, and not totally abstain from the fecond, if her nature require it, provided it be with her Husband, which liberty is freely given them by Jubertus in his 7th Chapter of his 5th Book of Popular Errors, founded upon the experience of all poor Women, who bring up their Children very well, notwithstanding they lie every Night with their Husbands; and of his own alledging that his Wife had nurfed his Children all very well, altho he lay with her every Night, and ca-Ee 4

refied her, (as he faid) like a good and faithful Husband; but the must forbear, at least an hour

or two after, to give the Child fuck.

If a Nurse hath all or most part of these Conditions here specified, as well respecting her Person as Manners, and that she maintains this condition by a Diet sit for the Child's temperament, and not contrary to her own, there is then great reason to believe she is sit to make a very good Nurse, and to bring up in persect health the Son of a Prince.

In fine, Loving Reader, I believe I have now acquitted my felf of my duty towards the Publick, in communicating the knowledg that God hath graciously bestowed on me concerning the Diseases of Women with Child, and in Child-bed: I pray God, the Fountain of all Science, that he will wouch afte to teach you the right way of helping them, and their Children, in these cases, and make you yet better able to conceive these things, than I have here explained them, and that all may be for ever to his greater Glory.

The End of the Third and Last Book.
